Appendices:

- A. Full Sized Conceptual Site Plan
- B. LOS Descriptions
- C. Crash Data & Traffic Counts
- D. Existing Synchro Outputs
- E. Background (without site development) Synchro Outputs
- F. Future (with site development) Synchro Outputs

## **Executive Summary**

### **Site Location and Study Area**

The property that comprises the application area for the proposed development is approximately 2.4 acres in size and is identified as Adams County Parcel Number 0172128300113. It is located north of the CO-2/Quebec Parkway/Rosemary Street intersection in Commerce City, CO. It is zoned Agricultural District (AG) and is currently occupied by a residential building.

The study area is generally bounded by CO-2 to the east, Rosemary Street to the west and south, and property lines to the north. The study area for the project includes those intersections identified by Staff that could be affected by the proposed development:

- CO-2/Quebec Parkway/Rosemary Street
- 80<sup>th</sup> Avenue/Rosemary Street
- Proposed site accesses

### **Description of Proposed Development**

The Applicant, QuikTrip, seeks to develop the property with a gas station with convenience store use. Site access is proposed via one right-in/right-out (RIRO) access and one full movement access on Rosemary Street.

## **Conclusions and Recommendations**

### **Conclusions**

Based on the results of this traffic impact study, the following may be concluded:

- Under existing traffic conditions, the intersections within the study area currently operate at overall acceptable levels of service (LOS) “C” or better during the weekday AM and PM peak hours, and queues remain within their respective storage lengths.
- Under background future 2025 and 2045 traffic conditions, without the development of the subject site, delays would increase slightly at study intersections due to regional traffic growth. The intersections are still forecasted to operate at LOS “D” or better.
- In the background future 2045 scenario, the SBL queue at the CO-2/Quebec Parkway/Rosemary Street intersection is expected to exceed its storage length during the AM peak hour.
- The proposed site development would generate, upon completion and full occupancy, 104 net new weekday AM and 91 net new weekday PM peak hour vehicle trips as well as 1,029 net new weekday daily trips.
- Under total future 2025 and 2045 traffic conditions with development of the site, the intersections within the study area would operate consistent with background conditions.

### **Recommendations**

- It is recommended that the Applicant provide access consistent with the site plan contained herein.

## I. Introduction

### Overview

This report presents the results of a Traffic Impact Study (TIS) conducted in support of a site plan to develop a gas station with convenience store use in Commerce City, CO. Currently the site vacant.

Per the requirements of the City of Commerce City Engineering Construction Standards and Specifications, a Transportation Impact Study is required to support the proposed development.

### Site Location and Study Area

The property that comprises the application area for the proposed development is approximately 2.4 acres in size and is identified as Adams County Parcel Number 0172128300113. It is located north of the CO-2/Quebec Parkway/Rosemary Street intersection in Commerce City, CO, as shown on Figure 1-1. It is zoned Agricultural District (AG) and is currently occupied by a residential building. Site access is proposed via one right-in/right-out (RIRO) access and one full movement access on Rosemary Street.

The Applicant, QuikTrip, seeks to develop the property with a gas station with convenience store use. A reduction of the Applicant's proposed conceptual site plan is provided on Figure 1-2. A full-size copy of the plan is provided in Appendix A.

The study area is generally bounded by CO-2 to the east, Rosemary Street to the west and south, and property lines to the north

Tasks undertaken in the course of this study included the following:

1. Reviewed the Applicant's proposed development plans and other background data.
2. Conducted a virtual field reconnaissance of existing roadway and intersection geometries, traffic controls, and speed limits.
3. Conducted peak hour turning movement counts at the key intersections.
4. Analyzed existing levels of service at each of the key study intersections based on the methodologies set forth in the Highway Capacity Guidelines (HCM) 6<sup>th</sup> Edition as reported by Synchro version 11.
5. Forecasted background future traffic volumes based on baseline traffic counts and regional traffic growth for 2025 (build-out) and 2045 (long-range) conditions.
6. Calculated background levels of service at each of the key study intersections for the projected build-out years based on background future traffic forecasts, and the existing lane use and traffic controls.
7. Estimated the number of AM and PM peak hour trips that would be generated by the proposed use based on the Institute of Transportation Engineers (ITE) Trip Generation 11<sup>th</sup> Edition rates/equations and methodologies
8. Prepared AM and PM peak hour total future traffic forecasts based on background traffic forecasts plus site traffic assignments for the 2025 (build-out), as well as 2045 (long-range) conditions.

9. Calculated total future levels of service for each of the key study intersections based on projected total future traffic forecasts, existing/future traffic controls and intersection geometries.
10. Identified roadway improvements required to accommodate future traffic volumes as necessary.

Sources of data for this analysis included the Institute of Transportation Engineers (ITE), Trip Generation, 11th edition, the Highway Capacity Guidelines HCM 6<sup>th</sup>, QuikTrip, City of Commerce City, Colorado and the files/library of Galloway.

## Site Description and Access

### **Site Conditions**

The terrain proximate to and surrounding the site is generally classified as “level”.

### **Hazardous Conditions**

Based on the field reconnaissance in the vicinity of the subject site, no hazardous features or constraints were identified.

### **Proposed Site Access**

Access to the site is being proposed via one right-in/right-out (RIRO) access and one full movement access on Rosemary Street.

### **Existing Zoning**

The subject site is currently zoned Agricultural District (AG) and is currently occupied by a residential building. Figure 1-3 depicts the existing zoning associated with the subject property, as well as neighboring properties as shown on the City of Commerce City zoning map.

### **Nearby Uses**

The properties surrounding the subject site are generally developed with a mix of industrial and commercial uses.

FIGURE 1-1

FIGURE 1-2  
SITE PLAN

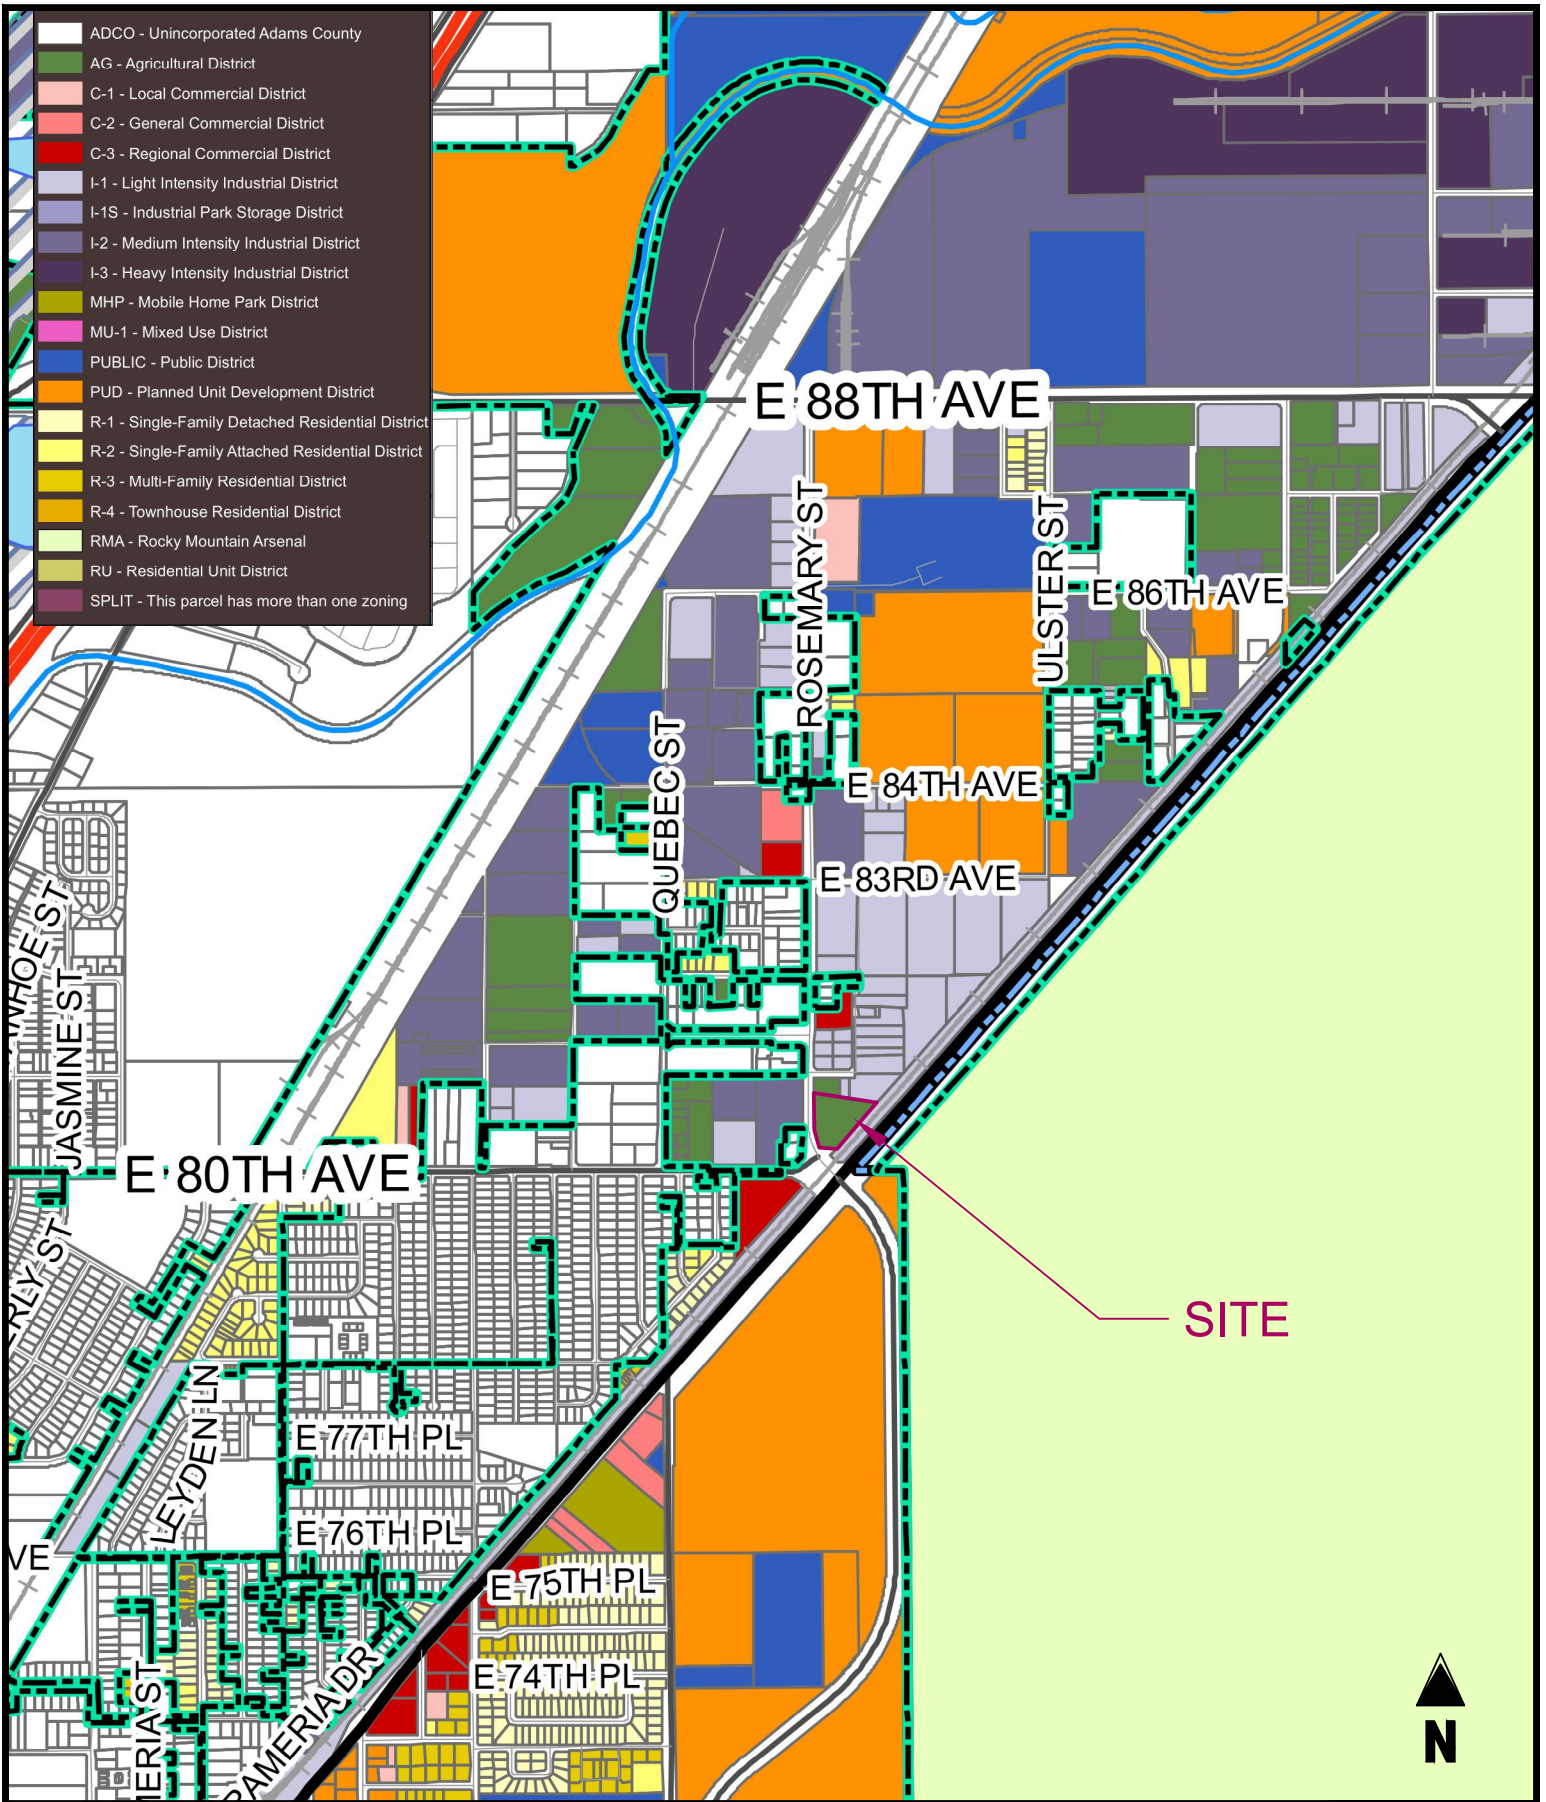

FIGURE 1-3  
EXISTING ZONING

## II. Background Information

### Study Area

The study area was determined by a review of intersections that would experience a significant portion of turning movement volumes generated by the site. As such, the traffic study focuses primarily on the following intersections:

#### **Study Intersections**

- CO-2/Quebec Parkway/Rosemary Street
- 80<sup>th</sup> Avenue/Rosemary Street
- Proposed site accesses

### Study Assumptions

For purposes of this analysis only, the proposed uses are assumed to be built and occupied in one distinct phase. It was assumed that the use would be built and operational in study year 2025. A long-term analysis of 2045 is also provided.

### Study Methodology

Synchro software version 11 was used to evaluate levels of service at each of the study intersections during the weekday AM and PM peak hours. Synchro is a macroscopic model used for optimizing traffic signal timing and performing capacity analyses. The software can model existing traffic signal timings or optimize splits, offsets, and cycle lengths for individual intersections, an arterial, or a complete network. Synchro allows the user to evaluate the effects of changing intersection geometrics, traffic demands, traffic control, and/or traffic signal settings as well as optimize traffic signal timings.

The levels of service reported for the signalized and unsignalized intersections analyzed herein were taken from the Highway Capacity Manual (HCM) 6<sup>th</sup> reports generated by Synchro 11. Level of service descriptions are included in Appendix B.

In order to maintain a conservative analysis a default percent heavy vehicle (%HV) factor of 6% was used for all movements in the study area consistent with collected data.

### Existing Roadway Network

Regional access to the subject site is provided via CO-2 and Quebec Parkway, and local access is provided via Rosemary Street. Figure 2-1 depicts existing lane use and traffic controls in the vicinity of the subject site. The following provides a description of each of the roadways within the study network.

#### **CO-2**

CO-2 is constructed as an east/west four-lane highway with turn lanes at major intersections and a posted speed limit of 45 mph in the vicinity of the subject site. The City of Commerce City classifies the road as a Principal Arterial. The intersection with the Quebec Parkway/Rosemary Street operates under signalized control.

### Quebec Parkway

Quebec Parkway is constructed as a north/south four-lane divided section with turn lanes at major intersections and a posted speed limit of 45 mph in the vicinity of the subject site. The City of Commerce City classifies the road as a Principal Arterial. The intersection with the CO-2/Rosemary Street operates under signalized control.

### Rosemary Street

Rosemary Street is constructed as a north/south four-lane divided section with a posted speed limit of 35 mph in the vicinity of the subject site. The City of Commerce City classifies the road as a Major Collector. The intersection with the CO-2/Quebec Parkway operates under signalized control.

## Crash Data

Crash data for traffic incidents that occurred between 2018-2022 in the vicinity of the subject site were obtained from the City. The data shows a total of 74 crashes reported at or near the CO-2/Quebec Parkway/Rosemary Street intersection and 63 crashes reported at various location along Rosemary Street over the 5 year period.

# of Crashes: (2018-2022)	CO-2/Quebec Parkway/Rosemary Street:
45	At Intersection/Intersection Related
29	Non-Intersection
<b>74</b>	<b>TOTAL</b>

This represents 9 at intersection crashes per year.

The provided data reports a total of 63 crashes at the following locations along Rosemary Street:

# of Crashes: (2018-2022)	Location:
2	80 <sup>th</sup> Avenue/Rosemary Street
12	81 <sup>st</sup> Avenue/Rosemary Street
4	82 <sup>nd</sup> Avenue/Rosemary Street
2	83 <sup>rd</sup> Avenue/Rosemary Street
20	84 <sup>th</sup> Avenue/Rosemary Street
19	86 <sup>th</sup> Avenue/Rosemary Street
4	Rosemary Street
<b>63</b>	<b>TOTAL</b>

This represents an average of 1.8 crashes per year at each intersection.

No specific safety issue was identified related to the reported crash data. Reduced data set provided within Appendix C.

FIGURE 2-1  
EXISTING LANE USE AND TRAFFIC CONTROL

### **III. Analysis of Existing Conditions**

#### **Traffic Volumes**

Weekday AM and PM peak hour traffic volumes counts were conducted on Wednesday November 02, 2022 from 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM at the study intersections by IDAX Data Solutions.

For purposes of this study, peak hour of the network was selected based on a review of the intersection volumes. These volumes were balanced to the greatest volumes observed to provide a conservative analysis.

The existing volumes are summarized on Figure 3-1. Copies of traffic counts are included in Appendix C. Existing peak hour factors (PHF) were also computed by approach from the traffic counts and applied to the analysis with a minimum of 0.85 and a maximum of 0.92.

#### **Operational Analysis**

Capacity/level of service (LOS) analyses were conducted at the study intersections based on the existing lane use and traffic controls shown on Figure 2-1 and existing baseline vehicular traffic volumes shown on Figure 3-1. The capacity analysis results are presented in Appendix D and summarized in Table 3-1 and on Figure 3-2.

As shown in Table 3-1, the signalized intersections in the study area currently operate at overall acceptable levels of service (LOS) "C" or better during the weekday peak hours. The stop control intersections operate at LOS "B" or better during the weekday peak hours.

#### **Existing Intersection Queues**

An analysis of intersection 95<sup>th</sup>-percentile queues was performed at key locations. The results of the queuing analysis, as reported by Synchro, are summarized in Table 3-2. As shown in the table, queues are contained within their effective storage.

## **IV. Analysis of Future Conditions without Site Development**

### **Methodology**

The future traffic forecasts, without the proposed new use, were developed for 2025 and 2045 conditions based on a composite of existing baseline traffic volumes and regional traffic. A 1.0% growth factor per year was applied to existing traffic on CO-2 and Quebec Parkway.

### **Regional Growth**

Increases in traffic associated with regional growth were estimated at 1.0 percent per year compounded for movements along CO-2 and Quebec Parkway up to 2025 as well as to 2045. This growth accounts for increases in traffic resulting from influences outside of the immediate study area. The resulting increases in volumes within the study area are reflected on Figure 4-1 for 2025 conditions and Figure 4-2 for 2045 conditions.

### **Background Traffic Forecasts**

The existing traffic forecasts depicted on Figure 3-1 and the regional growth shown on Figure 4-1 (2025) and Figure 4-2 (2045) were added together to yield the background future traffic forecasts shown on Figure 4-3 for 2025 conditions and Figure 4-4 for 2045 conditions.

### **Background Future Levels of Service**

Capacity analyses of 2025 and 2045 future traffic conditions without the proposed development are provided in Appendix F and summarized in Table 4-2. The forecasted levels of service are also depicted graphically on Figure 4-5 for 2025 conditions and Figure 4-6 for 2045 conditions.

As shown on Table 4-1, the intersections within the study area would continue to operate at overall acceptable LOS "D" or better during the AM and PM peak hours for background future conditions.

### **Background Future Queueing**

An analysis of intersection queues was performed at key locations under background future traffic conditions. The results of the queueing analysis are summarized in Table 4-3.

As shown in the table, queues within the study network will increase due to regional traffic growth. Forecasted queues are consistent with existing conditions. All queues are expected to be contained in their effective storage with the exception of the SBL movement at the CO-2/Quebec Parkway/Rosemary Street intersection during the AM peak hour under 2045 future traffic conditions.

## V. Site Analysis

### Overview

The Applicant is proposing to develop the approximately 2.4 acre site with a gas station with convenience store use. For purposes of this study, the site will be developed in one phase. For analysis purposes it was assumed that the development would be complete and occupied in 2025. The following use and development program was analyzed:

Proposed:

16      FP      Gas Station with Convenience Store

### Proposed Site Access

As shown on the Applicant's conceptual plan (Figure 1-2), access to the development is being proposed via on right-in/right-out (RIRO) access and one full movement access on Rosemary Street. Proposed lane use and traffic control is provided on Figure 5-1.

### Trip Generation

#### **Overview**

Trip generation estimates for the weekday AM and PM peak hours, as well as the weekday average daily traffic (ADT), were derived from the standard Institute of Transportation Engineers (ITE) Trip Generation Manual rates/equations, as published in the 11<sup>th</sup> edition. The trip generation analysis is presented in Table 5-1.

#### **Pass-by Trips**

According to ITE, in some cases the driveway volumes at a particular land use are different from the amount of traffic added to the adjacent street system. Uses such as retail establishments attract a portion of their trips from traffic that is already present on the road network. Pass-by trip are those trips which are made as intermediate stops on the way to a primary destination. An example of a pass-by trip would be one in which a driver stops at a gas station on his/her way home from work.

The proposed use would experience pass-by trips consistent with the primary uses located on site. In recognition of this phenomenon and consistent with ITE published data, the following pass-by reductions were applied to the trip generation analysis:

- Gas Station with convenience store: 76% AM/ 75% PM

As shown in Table 5-1, the site in total is anticipated to generate 329 weekday AM, and 273 weekday PM peak hour pass-by trips. Therefore, these trips would be drawn from the existing road network and assigned to the future site entrances accordingly. Pass-by trip assignments at key study intersections are shown on Figure 5-2.

#### **Net Site Trips**

The vehicle trips that would be generated by the proposed development plan are summarized in Table 5-1. As shown in Table 5-1, the site would generate upon completion and full occupancy 104 net new weekday AM and 91 net new weekday PM peak hour vehicle trips, as well as 1,029 net new weekday daily trips.

### **Site Trip Distributions**

The distribution of the anticipated trips generated by the completion of the proposed development was based on an examination of existing traffic counts and local knowledge. Existing travel patterns indicate the following distribution is appropriate in the forecasting of future site traffic:

- To/from the east on CO-2: 20%
- To/from the west on CO-2: 20%
- To/from the south on Quebec Street: 35%
- To/from the north on Rosemary Street: 25%

### **Site Trip Assignments**

The assignment of the new vehicle trips generated upon the future build-out of the development project was based on the above distribution. The trips assignments are depicted on Figure 5-3.

## **VI. Analysis of Future Conditions with Site Development**

### **Total Future Traffic Forecasts**

The 2025 and 2045 total future traffic forecasts associated with the proposed development were developed by combining the background future forecasts shown on Figure 4-3 (2025) and Figure 4-4 (2045), the pass-by trips shown on Figure 5-2, and the site trip assignments shown on Figure 5-3. The resulting total future traffic forecasts are provided on Figure 6-1 for 2025 (build-out), Figure 6-2 for 2045 (long-range) conditions.

### **Total Future Levels of Service with Proposed Development**

Future levels of service with the proposed development plan were estimated at key study intersections based on the future traffic volumes shown on Figures 6-1 and Figure 6-2, the future lane use on Figure 5-1, and the HCM 6<sup>th</sup> methodologies for signalized and unsignalized intersections. The results of these analyses are provided in Appendix H and presented in Table 6-1. Total future levels of service are also presented graphically on Figure 6-3 (2025) and Figure 6-4 (2045).

As shown in Table 6-1, levels of service under future site development conditions would remain generally consistent with future background conditions (i.e., without site development). Overall delays would experience minor increase due to site trips. The signalized intersections within the study area would continue to operate at acceptable overall LOS “D” or better in the AM and PM peak hours in all future scenarios, consistent with background future conditions.

The proposed site entrances are forecasted to operate at LOS “B” or better during the AM and PM peak hours, with the exception of the WB left movement at the North Site Access. Synchro, a macrosimulation, does not take into account platooning effects from nearby signals such as the signal south of the site at the CO-2/Quebec Parkway/Rosemary Street intersection, which would provide platoons in traffic and create gaps for the WB left turning movements. SimTraffic is a microsimulation software that more realistically models traffic through a network including platooning from nearby signals. Utilizing SimTraffic, the WB left movement at the North Site Access is forecasted to operate at acceptable LOS “D” during the AM and PM peak hours.

The majority of site generated traffic is assumed to access the site from the CO-2/Quebec Parkway/Rosemary Street intersection. This requires a left turn out of the site to re-enter the CO-2/Quebec Parkway/Rosemary Street intersection. Restricting access to RIRO only would result in an increase of out of direction travel and illegal U-turns for vehicles heading back to CO-2 and Quebec Parkway. As shown in the next section, no queuing issues are expected along Rosemary Street.

### **Total Future Queuing**

Total future queues were forecasted using Synchro/SimTraffic software. The results of the queuing analysis are summarized in Table 6-2. The forecasted queues are expected to remain consistent with background conditions.

### **Auxiliary Lanes**

The City of Commerce City Department of Public Works Engineering Construction Standards and Specifications (Standards) was referenced to determine the need for a right-turn deceleration lanes for the proposed Site Accesses along Rosemary Street.

With a forecasted right turn volume of 163 vehicles per hour in the AM peak hour, the southern RIRO site access warrants a right-turn deceleration lane for northbound right turning movements into the site.

**TABLE 3-6 RIGHT-TURN DECELERATION LANES**

	<b>Minimum # of Major Street Right Turns to Require Right-Turn Deceleration Lane on Major Street (vph)</b>	<b>Deceleration Lane Length (ft)</b>	<b>Taper Rate</b>	<b>Taper Length (ft) for 12' Lane</b>
<b>Principal Arterial</b>	15	185	18.5:1	222
<b>Minor/Multimodal Arterial</b>	20	135	15:1	180
<b>Major Collector</b>	25	90	13.5:1	162
<b>Minor Collector</b>	30	50	12:1	144

As Rosemary Street is classified as a Major Collector, per Table 3-6. Right-Turn Deceleration Lanes of the Standards, the deceleration lane should provide a deceleration distance of 90 feet and 162 foot taper.

## VII. Conclusions and Recommendations

### Conclusions

Based on the results of this traffic impact study, the following may be concluded:

- Under existing traffic conditions, the intersections within the study area currently operate at overall acceptable levels of service (LOS) “C” or better during the weekday AM and PM peak hours, and queues remain within their respective storage lengths.
- Under background future 2025 and 2045 traffic conditions, without the development of the subject site, delays would increase slightly at study intersections due to regional traffic growth. The intersections are still forecasted to operate at LOS “D” or better.
- In the background future 2045 scenario, the SBL queue at the CO-2/Quebec Parkway/Rosemary Street intersection is expected to exceed their storage length during the AM peak hour.
- The proposed site development would generate, upon completion and full occupancy, 104 net new weekday AM and 91 net new weekday PM peak hour vehicle trips as well as 1,029 net new weekday daily trips.
- Under total future 2025 and 2045 traffic conditions with development of the site, the intersections within the study area would operate consistent with background conditions.

### Recommendations

- It is recommended that the Applicant provide access consistent with the site plan contained herein.

## **APPENDIX B – LOS Descriptions**

## Level of Service for Signalized Intersections

Level of service for signalized intersections is defined in terms of delay, which is a measure of driver discomfort and frustration, fuel consumption, and lost travel time. Specifically, level-of-service (LOS) criteria are stated in terms of the average stopped delay per vehicle for a 15-min analysis period. The criteria are given in Exhibit 16-2. Delay may be measured in the field or estimated using procedures presented later in this chapter. Delay is a complex measure and is dependent on a number of variables, including the quality of progression, the cycle length, the green ratio, and the  $v/c$  ratio for the lane group in question.

**LOS A** describes operations with very low delay, up to 10 sec per vehicle. This level of service occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.

**LOS B** describes operations with delay greater than 10 and up to 20 sec per vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of average delay.

Exhibit 16-2. Level-of-Service Criteria for Signalized Intersections

LEVEL OF SERVICE	STOPPED DELAY PER VEHICLE (SEC)
A	$\leq 10.0$
B	$> 10.0$ and $\leq 20.0$
C	$> 20.0$ and $\leq 35.0$
D	$> 35.0$ and $\leq 55.0$
E	$> 55.0$ and $\leq 80.0$
F	$> 80.0$

**LOS C** describes operations with delay greater than 20 and up to 35 sec per vehicle. These higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.

**LOS D** describes operations with delay greater than 35 and up to 55 sec per vehicle. At level D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high  $v/c$  ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.

**LOS E** describes operations with delay greater than 55 and up to 80 sec per vehicle. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high  $v/c$  ratios. Individual cycle failures are frequent occurrences.

**LOS F** describes operations with delay in excess of 80 sec per vehicle. This level, considered to be unacceptable to most drivers, often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. It may also occur at high  $v/c$  ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels.

Source: [Highway Capacity Manual, 2000](#). Transportation Research Board, National Research Council

## Level of Service Criteria for Stop Sign Controlled Intersections

The level of service criteria are given in Table 17-2. As used here, control delay is defined as the total elapsed time from the time a vehicle stops at the end of the queue until the vehicle departs from the stop line; this time includes the time required for the vehicle to travel from the last-in-queue position to the first-in-queue position, including deceleration of vehicles from free-flow speed to the speed of vehicles in queue.

The average total delay for any particular minor movement is a function of the service rate or capacity of the approach and the degree of saturation. . . .

Table 17-2. Level of Service Criteria for TWSC Intersections

LEVEL OF SERVICE	AVERAGE CONTROL DELAY (sec/veh)
A	$\leq 10$
B	$> 10$ and $\leq 15$
C	$> 15$ and $\leq 25$
D	$> 25$ and $\leq 35$
E	$> 35$ and $\leq 50$
F	$> 50$

Average total delay less than 10 sec/veh is defined as Level of Service (LOS) A. Follow-up times of less than 5 sec have been measured when there is no conflicting traffic for a minor street movement, so control delays of less than 10 sec/veh are appropriate for low flow conditions. To remain consistent with the AWSC intersection analysis procedure described later in this chapter, a total delay of 50 sec/veh is assumed as the break point between LOS E and F.

The proposed level of service criteria for TWSC intersections are somewhat different from the criteria used in Chapter 16 for signalized intersections. The primary reason for this difference is that drivers expect different levels of performance from different kinds of transportation facilities. The expectation is that a signalized intersection is designed to carry higher traffic volumes than an unsignalized intersection. Additionally, several driver behavior considerations combine to make delays at signalized intersections less onerous than at unsignalized intersections. For example, drivers at signalized intersections are able to relax during the red interval, where drivers on the minor approaches to unsignalized intersections must remain attentive to the task of identifying acceptable gaps and vehicle conflicts. Also, there is often much more variability in the amount of delay experienced by individual drivers at unsignalized than signalized intersections. For these reasons, it is considered that the total delay threshold for any given level of service is less for an unsignalized intersection than for a signalized intersection. . . .

LOS F exists when there are insufficient gaps of suitable size to allow a side street demand to cross safely through a major street traffic stream. This level of service is generally evident from extremely long total delays experienced by side street traffic and by queueing on the minor approaches. The method, however, is based on a constant critical gap size - that is, the critical gap remains constant, no matter how long the side street motorist waits. LOS F may also appear in the form of side street vehicles' selecting smaller-than-usual gaps. In such cases, safety may be a problem and some disruption to the major traffic stream may result. It is important to note that LOS F may not always result in long queues but may result in adjustments to normal gap acceptance behavior. The latter is more difficult to observe on the field than queueing, which is more obvious.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.
