Warren, MI 48089

Re: Aberdeen Cross-Dock  
Logistics Facility  
Commerce City, CO  
LSC #151440

Dear Mr. Onifer:

In response to your request, LSC Transportation Consultants, Inc. has prepared this traffic impact analysis for the proposed Aberdeen Cross-Dock Logistics Facility. As shown on Figure 1, the site is located west of Stage Highway (SH) 2, south of E. 104<sup>th</sup> Avenue, and east of Lima Street in Commerce City, Colorado.

## REPORT CONTENTS

The report contains the following: the existing roadway and traffic conditions in the vicinity of the site including the lane geometries, traffic controls, posted speed limits, etc.; the existing weekday peak-hour traffic volumes; the existing daily traffic volumes in the area; the typical weekday site-generated traffic volume projections for the site; the assignment of the projected traffic volumes to the area roadways; the projected short-term and long-term background and resulting total traffic volumes on the area roadways; the site's projected traffic impacts; and any recommended roadway improvements to mitigate the site's traffic impacts.

## LAND USE AND ACCESS

The site is proposed to include a cross-dock logistics facility. Access is proposed from a full movement access to E. 104<sup>th</sup> Avenue via Peoria Parkway and an emergency-only access to E. 104<sup>th</sup> Avenue via Lima Street. Figure 2 shows the conceptual site plan.

## ROADWAY AND TRAFFIC CONDITIONS

### Area Roadways

The major roadways in the site's vicinity are shown on Figure 1 and are described below.

- **E. 104<sup>th</sup> Avenue** is an east-west, four-lane, principal arterial roadway north of the site. The intersection with Peoria Parkway is stop-sign controlled. The speed limit in the vicinity of the site is 45 mph. It is shown as a six-lane principal arterial at buildout per the *Commerce City C3 Vision Transportation Plan*.
- **SH 2** is a north-south, two-lane state highway east of the site. It is classified by CDOT as NR-A (Non-Rural Principal Highway). The intersection with E. 104<sup>th</sup> Avenue is signalized with auxiliary turn lanes. The speed limit in the vicinity of the site is 55 mph. It is shown as a four-lane state highway by 2035 per the *Commerce City C3 Vision Transportation Plan*.
- **Peoria Parkway** is a north-south, four-lane major collector roadway north of the site. The intersection with E. 104<sup>th</sup> Avenue is stop-sign controlled with auxiliary turn lanes but is planned for future signalization. The posted speed limit in the vicinity of the site is 35 mph.

### **Existing Traffic Conditions**

Figure 3 shows the existing lane geometries, traffic controls, and traffic volumes in the site's vicinity on a typical weekday. The weekday peak-hour traffic volumes and daily traffic counts are from the attached traffic counts conducted by Counter Measures in January, 2016.

### **2017 and 2035 Background Traffic**

Figure 4 shows the estimated 2017 background traffic and Figure 5 shows the estimated 2035 background traffic. The 2017 background traffic assumes an annual growth rate of about three percent from 2016 to 2017. The projected 2035 background traffic volumes on 104<sup>th</sup> Avenue and SH 2 are consistent with projections from the *C3 Vision Transportation Plan*. Peoria Parkway north of E. 104<sup>th</sup> Avenue was assumed to grow at an annual rate of about three percent for movements to/from the west and at two percent for movements to/from the east. The future land use between the site and E. 104<sup>th</sup> Avenue was assumed to develop primarily as retail space between 2017 and 2035. Specific uses assumed include a gas station with 16 fueling positions, 6,000 square feet of fast-food restaurant with drive-through, 8,000 square feet of sit-down restaurant, a bank with three drive-in lanes, and about 112,500 square feet of general retail space.

### **Existing, 2017, and 2035 Background Levels of Service**

Level of service (LOS) is a quantitative measure of the level of congestion or delay at an intersection. Level of service is indicated on a scale from "A" to "F." LOS A is indicative of little congestion or delay and LOS F is indicative of a high level of congestion or delay. Attached are specific level of service definitions for signalized and unsignalized intersections.

The intersections in Figures 3, 4, and 5 were analyzed to determine the existing, 2017, and 2035 background levels of service. Table 1 shows the level of service analysis results. The level of service reports are attached.

- **SH 2/E. 104<sup>th</sup> Avenue:** This signalized intersection currently operates at an overall LOS "C" during both morning and afternoon peak-hours. By 2035, the intersection is expected to operate at an overall LOS "D" during both morning and afternoon peak-hours.

- **E. 104<sup>th</sup> Avenue/Peoria Parkway:** The southbound left-turn movement currently operates at LOS "F" during the morning peak-hour and LOS "E" during the afternoon peak-hour and is expected to operate poorly until the intersection is signalized. Without signalized control, the side road left-turn movement onto E. 104<sup>th</sup> Avenue is expected to operate at LOS "E" or "F". As a signalized intersection it is expected to operate at an overall LOS "C" during both morning and afternoon peak-hours through 2035.
- **E. 104<sup>th</sup> Avenue/Lima Street:** All movements at this unsignalized three-quarter movement intersection currently operate at LOS "B" or better during both morning and afternoon peak-hours and are expected to operate at LOS "C" or better through 2035.

## **TRIP GENERATION**

Table 2 shows the estimated average weekday, morning peak-hour, and afternoon peak-hour trip generation for the proposed site for two scenarios based on information from the applicant.

In 2017, the site is projected to generate about 330 vehicle-trips on the average weekday, with about half entering and half exiting the site during a 24-hour period. During the morning peak-hour, which generally occurs for one hour between 6:30 and 8:30 a.m., about 30 vehicles would enter and about 50 vehicles would exit the site. During the afternoon peak-hour, which generally occurs for one hour between 4:00 and 6:00 p.m., about 40 vehicles would enter and about 30 vehicles would exit the site.

In 2035, the site is projected to generate about 500 vehicle-trips on the average weekday, with about half entering and half exiting the site during a 24-hour period. During the morning peak-hour, which generally occurs for one hour between 6:30 and 8:30 a.m., about 45 vehicles would enter and about 75 vehicles would exit the site. During the afternoon peak-hour, which generally occurs for one hour between 4:00 and 6:00 p.m., about 60 vehicles would enter and about 45 vehicles would exit the site.

## **TRIP DISTRIBUTION AND ASSIGNMENT**

Figure 6 shows the estimated directional distribution of the site-generated traffic volumes on the area roadways. The estimates were based on the location of the site with respect to the regional population, employment, and activity centers and the site's proposed land use.

## **SITE-GENERATED TRAFFIC**

Figure 7a shows the estimated 2017 site-generated traffic volumes which are the directional distribution percentages (from Figure 6) applied to the appropriate trip generation estimate (from Table 2).

Figure 7b shows the estimated 2035 site-generated traffic volumes which are the directional distribution percentages (from Figure 6) applied to the appropriate trip generation estimate (from Table 2).

## 2017 AND 2035 TOTAL TRAFFIC

Figure 8 shows the 2017 total traffic which is the sum of the 2017 background traffic volumes (from Figure 4) and the 2017 site-generated traffic volumes (from Figure 7a). Figure 8 also shows the 2017 lane geometry and traffic control.

Figure 9 shows the 2035 total traffic which is the sum of 2035 background traffic volumes (from Figure 5) and the 2035 site-generated traffic volumes (from Figure 7b). Figure 9 also shows the 2035 lane geometry and traffic control.

## PROJECTED LEVELS OF SERVICE

The intersections in Figures 8 and 9 were analyzed to determine the 2016 and 2035 total levels of service. Table 1 shows the level of service analysis results. The level of service reports are attached.

- **SH 2/E. 104<sup>th</sup> Avenue:** This signalized intersection is expected to operate at an overall LOS “D” during both peak-hours through 2035 with or without the addition of site traffic.
- **E. 104<sup>th</sup> Avenue/Peoria Parkway:** This intersection is expected to operate at an overall LOS “C” in 2035 with traffic signal control. The side road approaches are expected to have significant delay until traffic signal control is implemented as shown in the 2017 analyses.
- **E. 104<sup>th</sup> Avenue/Lima Street:** All movements at this unsignalized three-quarter movement intersection are expected to operate at LOS “C” or better during both morning and afternoon peak-hours through 2035.

## CONCLUSIONS AND RECOMMENDATIONS

### Trip Generation

1. In 2017, the site is projected to generate about 330 vehicle-trips on the average weekday, with about half entering and half exiting the site during a 24-hour period. During the morning peak-hour, about 30 vehicles would enter and about 50 vehicles would exit the site. During the afternoon peak-hour, about 40 vehicles would enter and about 30 vehicles would exit the site.
2. In 2035, the site is projected to generate about 500 vehicle-trips on the average weekday, with about half entering and half exiting the site during a 24-hour period. During the morning peak-hour, about 45 vehicles would enter and about 75 vehicles would exit the site. During the afternoon peak-hour, about 60 vehicles would enter and about 45 vehicles would exit the site.

### Projected Levels of Service

3. The southbound left-turn movement at the intersection of E. 104<sup>th</sup> Avenue/Peoria Parkway currently operates at LOS “F” and is expected to do so until traffic signal control is implemented.

4. All movements at the intersections analyzed are expected to operate at LOS "D" or better during both morning and afternoon peak-hours through 2035, with or without the addition of site traffic assuming the E. 104<sup>th</sup> Avenue/Peoria Parkway intersection is signalized and State Highway 2 is widened to four through lanes by 2035. The Peoria Parkway side road left-turn movements onto 104<sup>th</sup> Avenue are expected to operate at LOS "E" or "F" until traffic signal control is implemented.

**Recommendations**

5. The City should consider implementing traffic signal control at the intersection of E. 104<sup>th</sup> Avenue and Peoria Parkway based on the existing traffic volumes. The southbound left-turn movement currently operates at LOS "F" and is a high enough volume to likely warrant traffic signal control. A traffic signal warrant will likely not be met based on the northbound approach traffic volumes until additional development occurs beyond the proposed site. Both side road approaches are expected to experience significant delay until traffic signal control is implemented. The applicant has been asked to contribute 4.69 percent of the future traffic signal cost or \$17,780 of the estimated \$379,300 total cost.

\* \* \* \* \*

We trust our findings will assist you in gaining approval of the proposed Aberdeen Cross-Dock Logistics Facility development. Please contact me if you have any questions or need further assistance.

Sincerely,

LSC TRANSPORTATION CONSULTANTS, INC.

## LEVEL OF SERVICE DEFINITIONS

From *Highway Capacity Manual*, Transportation Research Board, 2010

### SIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)

<u>LOS</u>	<u>Average Vehicle Delay</u> sec/vehicle	<u>Operational Characteristics</u>
A	<10 seconds	Describes operations with low control delay, up to 10 sec/veh. This LOS occurs when progression is extremely favorable and most vehicles arrive during the green phase. Many vehicles do not stop at all. Short cycle lengths may tend to contribute to low delay values.
B	10 to 20 seconds	Describes operations with control delay greater than 10 seconds and up to 20 sec/veh. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.
C	20 to 35 seconds	Describes operations with control delay greater than 20 and up to 35 sec/veh. These higher delays may result from only fair progression, longer cycle length, or both. Individual cycle failures may begin to appear at this level. Cycle failure occurs when a given green phase does not serve queued vehicles, and overflows occur. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.
D	35 to 55 seconds	Describes operations with control delay greater than 35 and up to 55 sec/veh. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	55 to 80 seconds	Describes operations with control delay greater than 55 and up to 80 sec/veh. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent.
F	>80 seconds	Describes operations with control delay in excess of 80 sec/veh. This level, considered unacceptable to most drivers, often occurs with over-saturation, that is, when arrival flow rates exceed the capacity of lane groups. It may also occur at high v/c ratios with many individual cycle failures. Poor progression and long cycle lengths may also contribute significantly to high delay levels.

## LEVEL OF SERVICE DEFINITIONS

**From *Highway Capacity Manual*, Transportation Research Board, 2010**

### **UNSIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)**

Applicable to Two-Way Stop Control, All-Way Stop Control, and Roundabouts

LOS	Average Vehicle Control Delay	Operational Characteristics
<b>A</b>	<10 seconds	Normally, vehicles on the stop-controlled approach only have to wait up to 10 seconds before being able to clear the intersection. Left-turning vehicles on the uncontrolled street do not have to wait to make their turn.
<b>B</b>	10 to 15 seconds	Vehicles on the stop-controlled approach will experience delays before being able to clear the intersection. <u>The delay could be up to 15 seconds.</u> Left-turning vehicles on the uncontrolled street may have to wait to make their turn.
<b>C</b>	15 to 25 seconds	Vehicles on the stop-controlled approach can expect delays in the range of 15 to 25 seconds before clearing the intersection. Motorists may begin to take chances due to the long delays, thereby posing a safety risk to through traffic. <u>Left-turning vehicles on the uncontrolled street will now be required to wait to make their turn causing a queue to be created in the turn lane.</u>
<b>D</b>	25 to 35 seconds	This is the point at which a traffic signal may be warranted for this intersection. The delays for the stop-controlled intersection are not considered to be excessive. The length of the queue may begin to block other public and private access points.
<b>E</b>	35 to 50 seconds	The delays for all critical traffic movements are considered to be unacceptable. The length of the queues for the stop-controlled approaches as well as the left-turn movements are extremely long. <u>There is a high probability that this intersection will meet traffic signal warrants.</u> The ability to install a traffic signal is affected by the location of other existing traffic signals. Consideration may be given to restricting the accesses by eliminating the left-turn movements from and to the stop-controlled approach.
<b>F</b>	>50 seconds	The delay for the critical traffic movements are probably in excess of 100 seconds. The length of the queues are extremely long. Motorists are selecting alternative routes due to the long delays. <u>The only remedy for these long delays is installing a traffic signal or restricting the accesses.</u> The potential for accidents at this intersection are extremely high due to motorist taking more risky chances. If the median permits, motorists begin making two-stage left-turns.
