## **1.0 EXECUTIVE SUMMARY**

---

An industrial project named 100<sup>th</sup> and Havana is proposed to be located along the east side of Havana Street between 102<sup>nd</sup> Avenue and Heinz Way in Commerce City, Colorado. The project is anticipated to consist of three (3) industrial warehouse buildings totaling approximately 302,500 square feet. It is expected that the project would be completed by the end of 2022. Analysis was therefore completed for the 2022 short term and 2040 long term horizons per City of Commerce City and State of Colorado Department of Transportation (CDOT) requirements.

The purpose of this study is to identify project traffic generation characteristics, to identify potential project traffic related impacts on the local street system, and to develop mitigation measures required for identified impacts. The following intersections were incorporated into this traffic study:

- 104<sup>th</sup> Avenue (SH-44) and Joliet Street
- 96<sup>th</sup> Avenue and Havana Street
- 96<sup>th</sup> Avenue and State Highway 2 (SH-2)

In addition, a northern right-in/right-out access and a southern full movement access along Havana Street were also included for evaluation.

Regional access to the project will be provided by US-85, Interstate 76, and E-470. Primary access will be provided by 104<sup>th</sup> Avenue, Havana Street, and 96<sup>th</sup> Avenue. Direct access to the site will be provided by one right-in/right-out access and a full movement access along Havana Street. The north project access along Havana Street is proposed to be a right-in/right-out access located approximately 3,700 feet south of the 104<sup>th</sup> Avenue/Joliet Street Intersection. The south project access along Havana Street is proposed to be a full movement access located approximately 4,100 feet south of the 104<sup>th</sup> Avenue/Joliet Street intersection.

100<sup>th</sup> and Havana is expected to generate approximately 1,020 weekday daily trips. Of these, 121 trips are expected to occur during both the morning and afternoon peak hours.

Distribution of project traffic on the street system was based on the area street system characteristics, existing traffic patterns and volumes, demographic information, and the

proposed access system for the project. Assignment of project traffic was based upon the trip generation described previously and the distributions developed.

Based on the analysis presented in this report, Kimley-Horn believes the 100<sup>th</sup> and Havana project proposed on the east side of Havana Street between 102<sup>nd</sup> Avenue and Heinz Way will be successfully incorporated into the existing and future roadway network. The proposed project development resulted in the following recommendations and conclusions:

### **2022 Buildout Improvement Recommendations**

- The threshold for requiring access permits along CDOT roadways occurs when project traffic is anticipated to increase the existing access traffic volumes by more than 20 percent. Both SH-2 and 104<sup>th</sup> Avenue (SH-44) exist within the project study area and are CDOT roadways. Based on projections, the addition of 100<sup>th</sup> and Havana project traffic at the intersections of 96<sup>th</sup> Avenue/SH-2 and 104<sup>th</sup> Avenue (SH-44)/Joliet Street does not increase traffic volumes by more than 20 percent over existing; therefore, access permits are not anticipated to be required for these intersections.
- Direct access to the site is proposed to be one northern right-in/right-out access and one southern full movement access along Havana Street, approximately 3,700 feet and 4,100 feet (measured center to center) south of the 104<sup>th</sup> Avenue/Joliet Street intersection, respectively. It is recommended that the exiting access approaches at both accesses to Havana Street be stop controlled with the installation of R1-1 “STOP” signs. One vehicle of storage, 25 feet for passenger cars or 50 feet for trucks, of throat depth is recommended to be provided for the project accesses based on vehicle usage anticipated.
- To restrict the northern access to right turn movements only, it is recommended that a R3-5(R) Right Turn Only sign be installed underneath the STOP sign. Likewise, a R3-2 No Left Turn sign should be installed on the southeast corner of the access intersection visible to southbound drivers along Havana Street.
- Per City of Commerce City Standards, it is recommended that a 140-foot southbound left turn lane with a 175-foot taper be constructed at the southern full movement project access along Havana Street. Construction of this southbound left turn lane will require the through

lanes along Havana Street to be transitioned around this left turn lane at a taper rate of approximately 20.5 to 1 (based on  $L = (W^*S^2)/60$ ). These through lane transitions will be planned and designed so that the bridge over the ditch to the north is not impacted. Likewise, a northbound right turn lane of 90 feet with a 175-foot taper is warranted based on City standards for the southern access.

- With construction of the project, the City of Commerce City is requiring build out of the eastern half of Havana Street to the ultimate cross section along project frontage. Havana Street is classified as a Major Collector roadway; therefore, the widening is anticipated to consist of 12 additional feet with a 6-foot designated bicycle lane. To accommodate this roadway widening, an additional 13 feet of right-of-way will be dedicated along Havana Street.

#### **2040 Long-Term Improvement Recommendations**

- By 2040, the intersection of 96<sup>th</sup> Avenue and SH-2 may operate unacceptably during the morning peak hour with or without the addition of project traffic if future traffic volume projections are realized. In order for this intersection to operate acceptably at LOS D, an additional westbound left turn lane may need to be constructed for dual left turn lanes to operate with protected only phasing. Also, the northbound right turn lane may need to be extended from 275 feet to 300 feet and the northbound right turn movement may need to operate with protected overlap phasing. Of note, none of these improvements and movements are anticipated to include traffic from this project.

#### **General Improvements**

- All on-site improvements should be incorporated into the Civil Drawings and conform to standards of the City of Commerce City, The Colorado Department of Transportation (CDOT), and the Manual on Uniform Traffic Control Devices (MUTCD) – 2009 Edition.

## **2.0 INTRODUCTION**

---

Kimley-Horn and Associates, Inc. has prepared this report to document the results of a Traffic Impact Study of future traffic conditions associated with the 100<sup>th</sup> and Havana project proposed to be located along the east side of Havana Street between 102<sup>nd</sup> Avenue and Heinz Way in Commerce City, Colorado. The vicinity map illustrating the project site location is shown in **Figure 1**. The project is proposed to be located on approximately 26.6 acres of vacant land. The development is anticipated to include three (3) industrial warehouse buildings totaling approximately 302,500 square feet. A conceptual site plan illustrating the project and access locations is shown in **Appendix F**. It is expected that the project will be completed by the end of 2022. Analysis was therefore completed for the 2022 short term and 2040 long term horizons per City of Commerce City and State of Colorado Department of Transportation (CDOT) requirements.

The purpose of this study is to identify project traffic generation characteristics, to identify potential project traffic related impacts on the local street system, and to develop mitigation measures required for identified impacts. The following intersections were incorporated into this traffic study:

- 104<sup>th</sup> Avenue (SH-44) and Joliet Street
- 96<sup>th</sup> Avenue and Havana Street
- 96<sup>th</sup> Avenue and State Highway 2 (SH-2)

In addition, two accesses along Havana Street were also included for evaluation. The north project access along Havana Street is proposed to be a right-in/right-out access located approximately 3,700 feet south of the 104<sup>th</sup> Avenue/Joliet Street Intersection. The south project access along Havana Street is proposed to be a full movement access located approximately 4,100 feet south of the 104<sup>th</sup> Avenue/Joliet Street intersection.

COMMERCE CITY, CO  
VICINITY MAP

FIGURE 1

## **3.0 EXISTING AND FUTURE CONDITIONS**

---

### **3.1 Existing Study Area**

The existing site is located on vacant land east of Havana Street. North of the project site is agricultural land and an irrigation ditch. This irrigation ditch also parallels Havana Street along the west side of the roadway across from the project site. To the south and west of the site, there are industrial areas with various facilities. To the east of the project site there is vacant land and a residential development to the southeast across SH-2. The surrounding area within the site study area is shown within the aerial of **Figure 2**.

### **3.2 Existing Roadway Network**

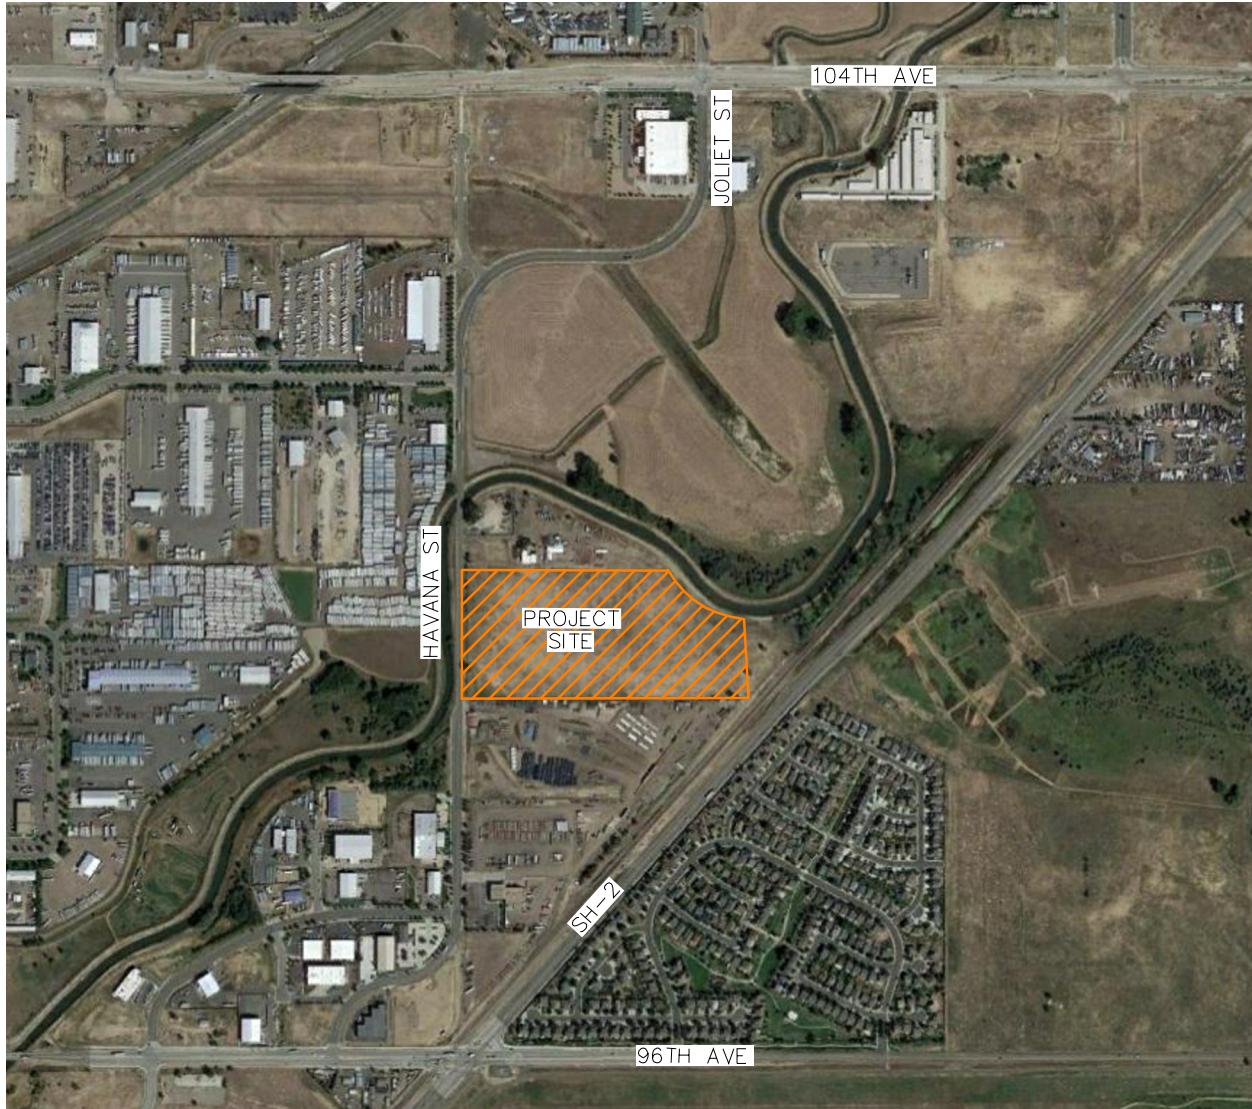

Regional access to the project will be provided by US-85, Interstate 76, and E-470. Primary access will be provided by 104<sup>th</sup> Avenue, Havana Street, and 96<sup>th</sup> Avenue.

104<sup>th</sup> Avenue (SH-44) is a raised median divided roadway providing two through lanes in each direction eastbound and westbound with a posted speed limit of 45 miles per hour through the study intersection with Joliet Street.

Havana Street is classified as a Major Collector. It presently provides one lane of travel each direction, northbound and southbound, with a 35 mile per hour posted speed limit within the study area.

96<sup>th</sup> Avenue is a raised median divided roadway providing two through lanes in each direction eastbound and westbound with a posted speed limit of 40 miles per hour through the study intersection with Havana Street.

SH-2 is a divided roadway providing two through lanes in each direction northbound and southbound with a posted speed limit of 45 miles per hour through the study intersection with 96<sup>th</sup> Avenue.

100TH AND HAVANA  
COMMERCE CITY, CO  
SITE AREA

FIGURE 2

The existing intersection of 104<sup>th</sup> Avenue and Joliet Street is signalized with protected/permissive phasing on all left turns. The eastbound approach consists of an exclusive left turn lane, two through lanes, and one right turn lane. The westbound approach consists of an exclusive left turn lane and two through lanes with the outside through lane being a shared through/right turn lane. The northbound approach consists of an exclusive left turn lane, one through lane, and one right turn lane. The southbound approach consists of an exclusive left turn lane and a shared through/right turn lane.

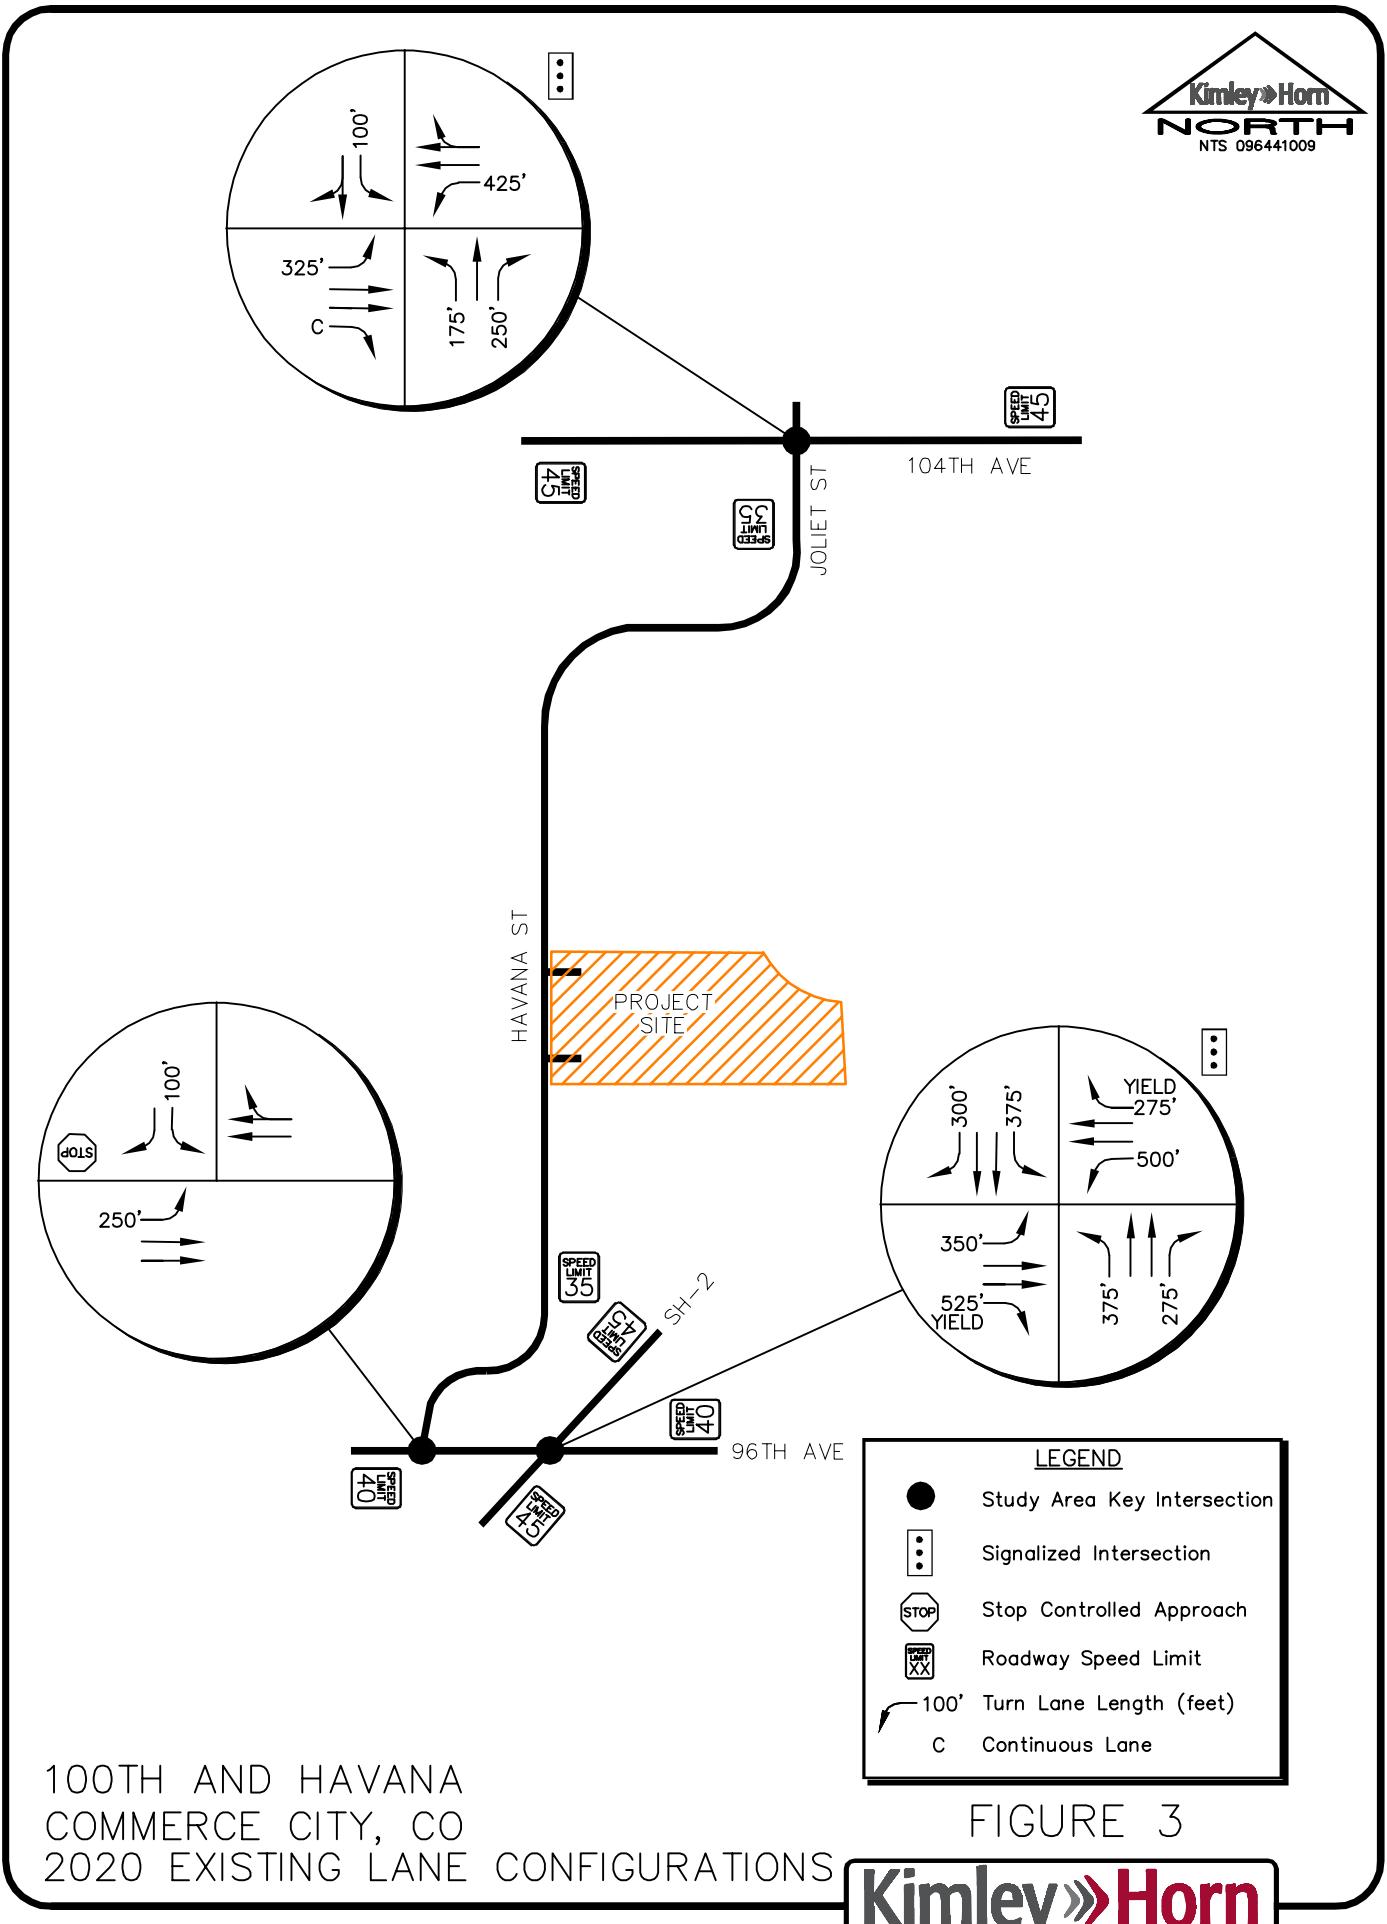

The 96<sup>th</sup> Avenue and Havana Street intersection is an unsignalized T-intersection with stop control on the southbound Havana Street approach. The eastbound approach consists of an exclusive left turn lane and two through lanes. The westbound approach consists of a through lane and a shared through/right turn lane. The southbound approach consists of separate left turn and right turn lanes.

The existing intersection of 96<sup>th</sup> Avenue and SH-2 is signalized with protected/permitted left turn phasing on all four approaches. All approaches consist of an exclusive left turn lane, two through lanes, and an exclusive right turn lane.

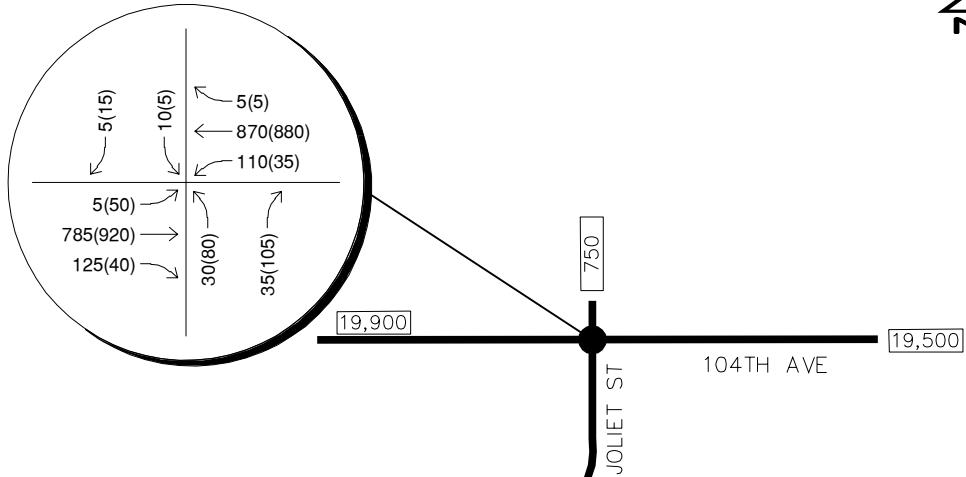

The Colorado Department of Transportation (CDOT) categorizes 104<sup>th</sup> Avenue (SH-44) through the study area as NR-B: Non-Rural Arterial. Commerce City categorizes 104<sup>th</sup> Avenue as a principal arterial roadway, Havana Street as a major collector, and 96<sup>th</sup> Avenue as a minor arterial as identified within the Commerce City Comprehensive Transportation Plan. The intersection lane configuration and control for the study area intersections are shown in **Figure 3**.

### **3.3 Existing Traffic Volumes**

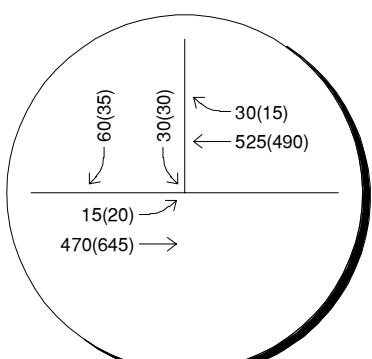

Existing peak hour turning movement counts were conducted at the study intersections on Tuesday, September 17, 2019 at the key intersections. The counts were conducted during the morning and afternoon peak hours of adjacent street traffic in 15-minute intervals from 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. These counts were adjusted to 2020 volumes using a 1.44 percent annual growth in order to incorporate the signal that was installed at the intersection of 104<sup>th</sup> Avenue and Joliet Street in mid-2020. The 2020 turning movement volumes are shown in **Figure 4** with count sheets provided in **Appendix A**.

### **3.4 Unspecified Development Traffic Growth**

According to information provided on the website for the Colorado Department of Transportation (CDOT), the 20-year growth factor along 104<sup>th</sup> Avenue (SH-44) in the vicinity of the site is 1.37. This equates to an annual growth rate of approximately 1.44 percent. Traffic information from the CDOT Online Transportation Information System (OTIS) website is included in **Appendix B**. This annual growth rate was used to estimate near term 2022 and long term 2040 traffic volume projections at the key intersections. Background traffic volumes for 2022 are shown in **Figure 5**. Background traffic volumes for 2040 are shown in **Figure 6**.

FIGURE 6

## 4.0 PROJECT TRAFFIC CHARACTERISTICS

---

### 4.1 Trip Generation

Site-generated traffic estimates are determined through a process known as trip generation. Rates and equations are applied to the proposed land uses to estimate traffic generated by the development during a specific time interval. The acknowledged source for trip generation rates is the *Trip Generation Manual*<sup>1</sup> published by the Institute of Transportation Engineers (ITE). ITE has established trip rates in nationwide studies of similar land uses. For this study, Kimley-Horn used the ITE Trip Generation Report average rate equation that applies to the Industrial Park use (ITE Code 130) for traffic associated with the development.

The 100<sup>th</sup> and Havana project is expected to generate approximately 1,020 daily weekday trips, with 121 of trips occurring during both the morning and afternoon peak hours. Calculations were based on the procedure and information provided in the ITE *Trip Generation Manual, 10<sup>th</sup> Edition – Volume 1: User's Guide and Handbook*, 2017. **Table 1** summarizes the estimated trip generation for the proposed development. The trip generation worksheets are included in **Appendix C**.

**Table 1 – 100<sup>th</sup> and Havana Traffic Generation**

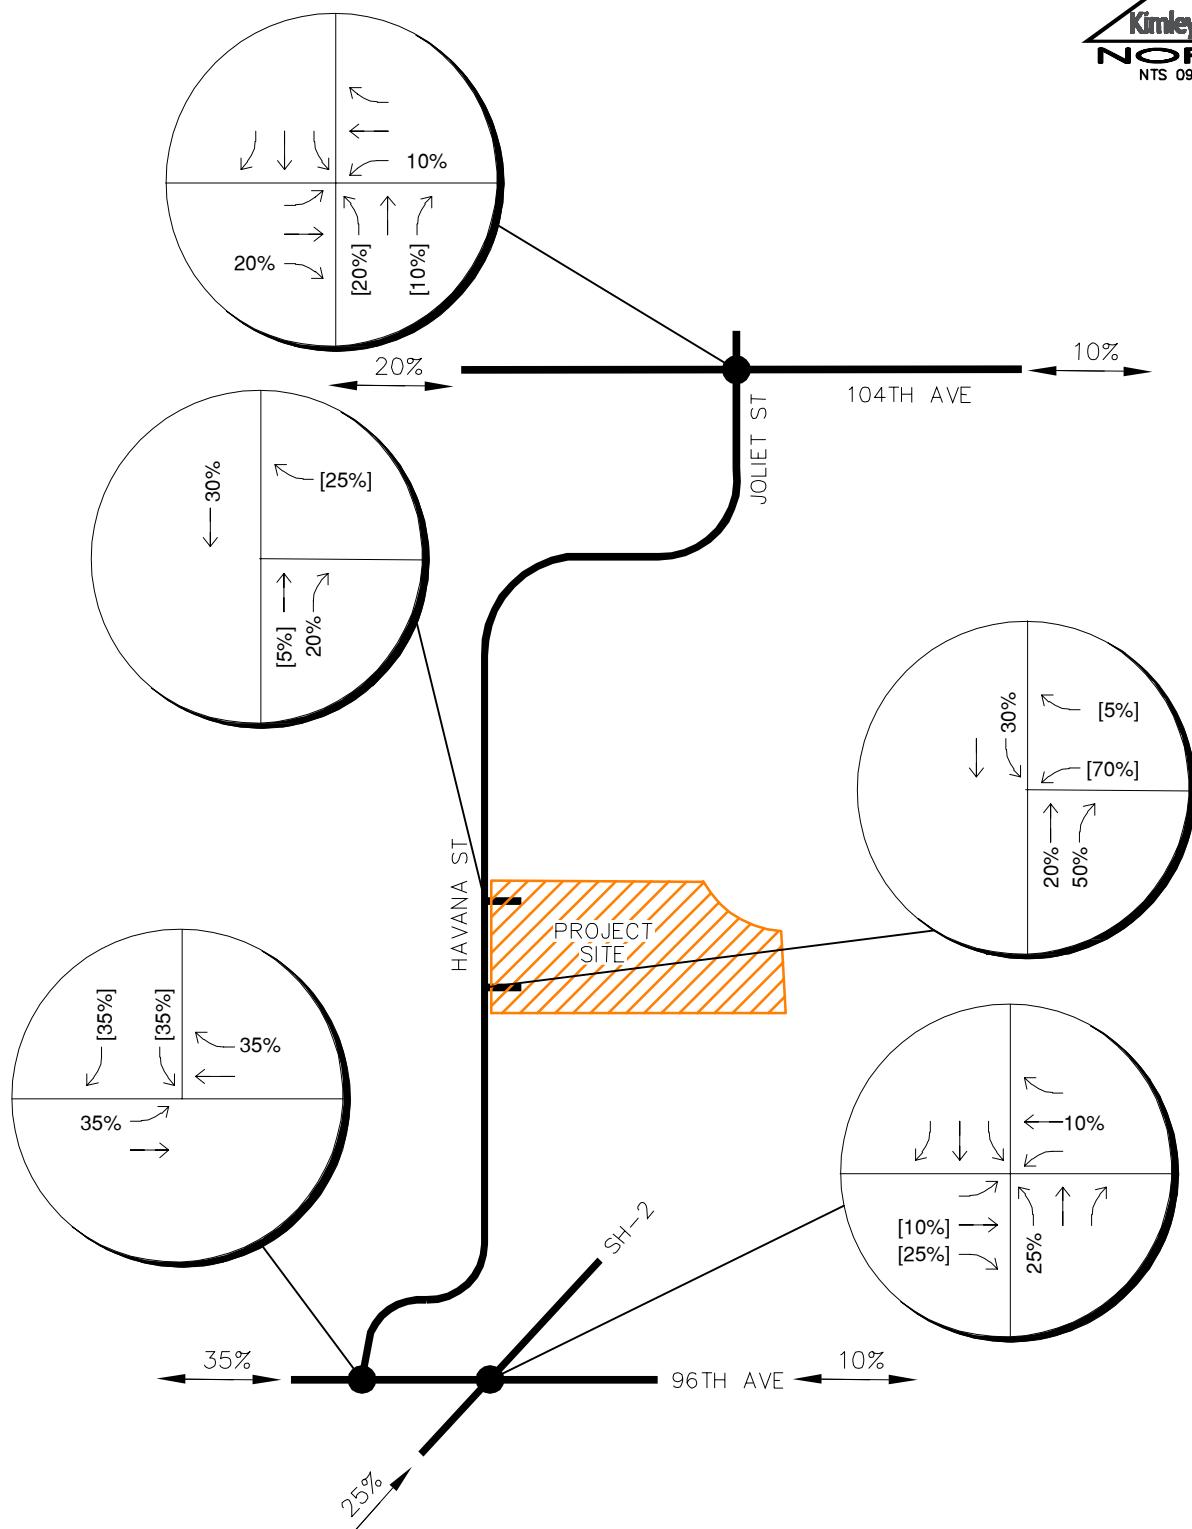

Land Use	Daily	AM Peak Hour			PM Peak Hour		
		In	Out	Total	In	Out	Total
Industrial Park (ITE130) – 302,500 Square Feet	1,020	98	23	121	25	96	121

### 4.2 Trip Distribution

Distribution of site traffic was based on the area street system characteristics, existing traffic patterns and volumes, existing demographic information, and the proposed access system for the project. The directional distribution of traffic is a means to quantify the percentage of site-generated traffic that approaches the site from a given direction and departs the site back to the original source. The project trip distribution is illustrated in **Figure 7**.

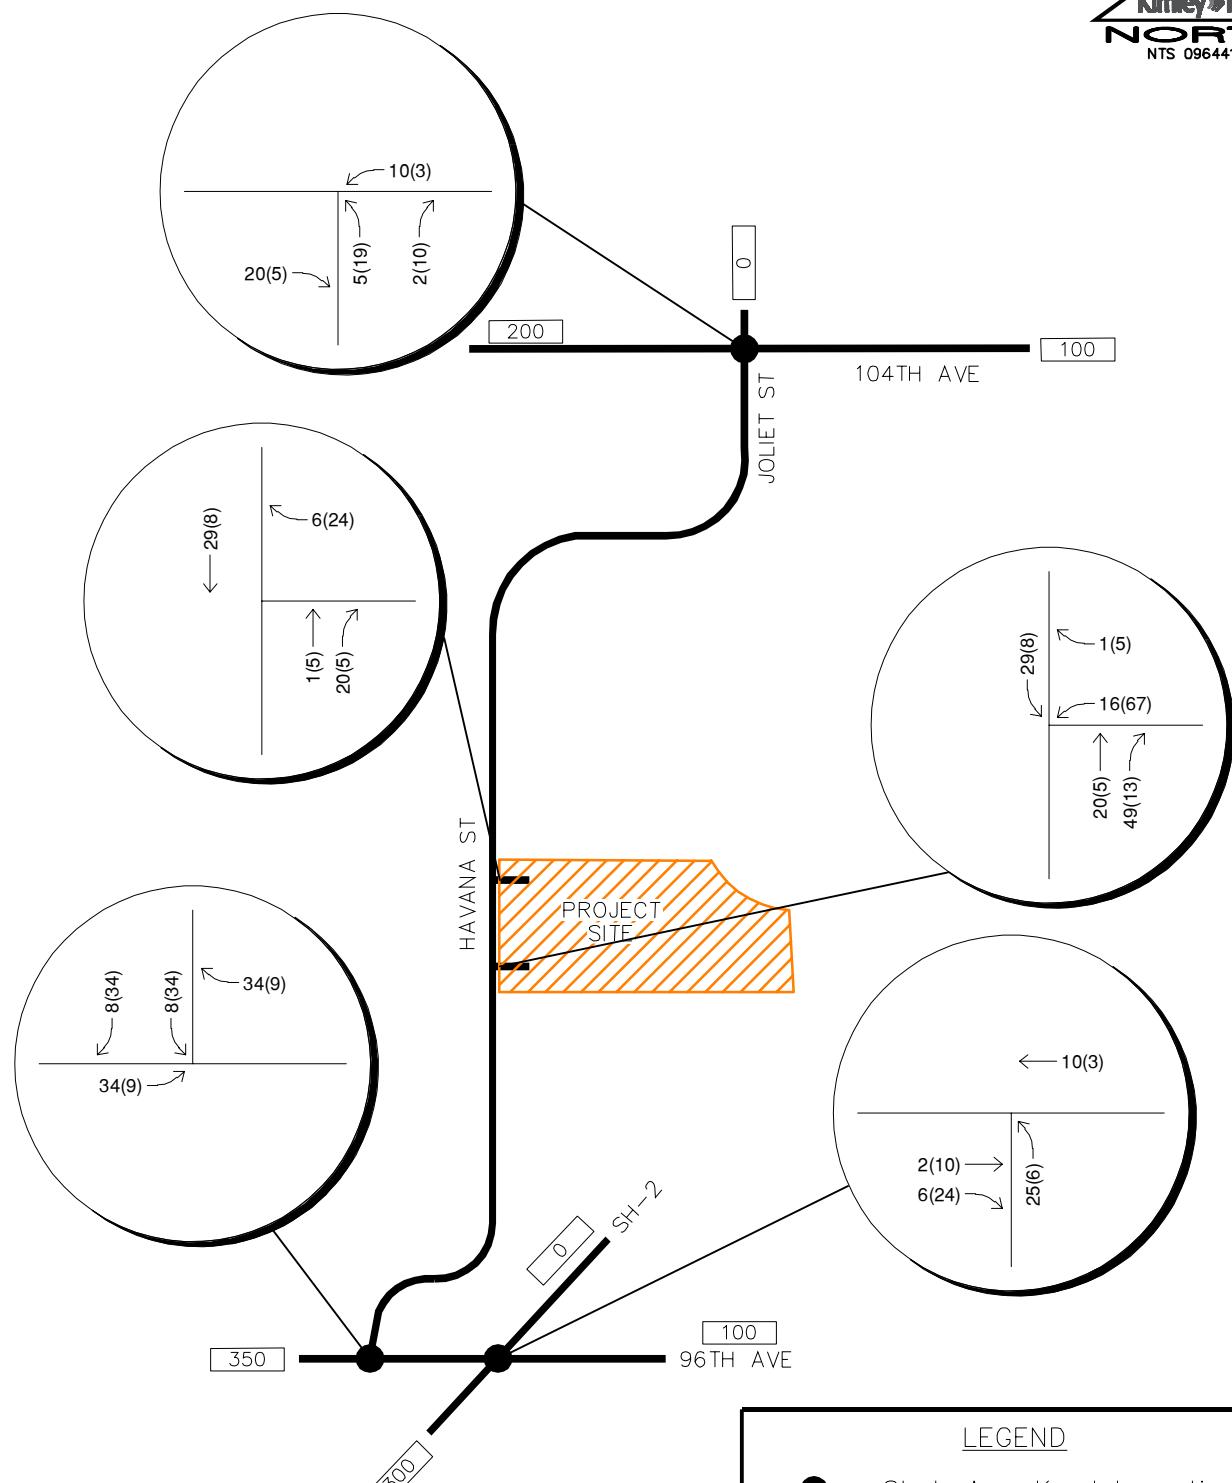

FIGURE 7

#### **4.3 Traffic Assignment**

Project traffic assignment was obtained by applying the project trip distribution to the estimated traffic generation of the development shown in **Table 1**. Project traffic assignment for 100<sup>th</sup> and Havana is shown in **Figure 8**.

#### **4.4 Total (Background Plus Project) Traffic**

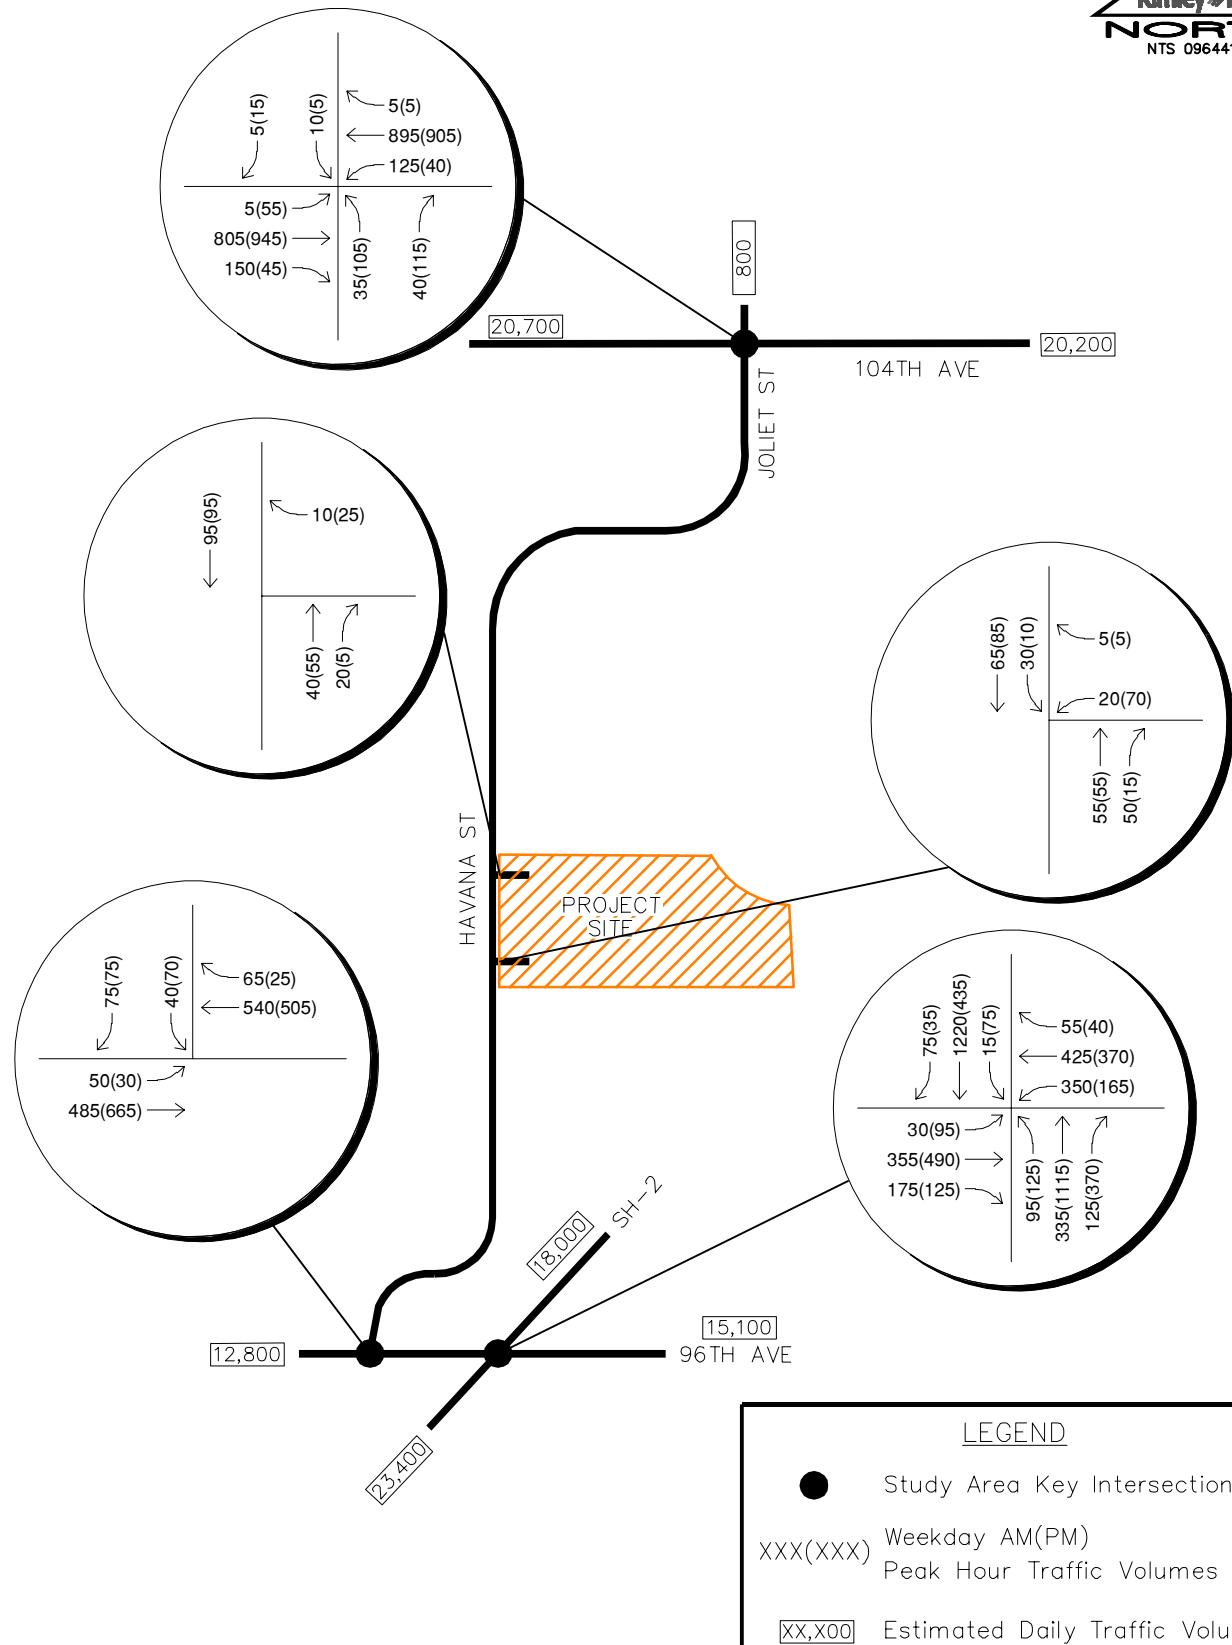

Site traffic volumes were added to the background volumes to represent estimated traffic conditions for the short term 2022 horizon and long term 2040 horizon. These total traffic volumes for the site are illustrated for the 2022 and 2040 horizon years in **Figures 9 and 10**, respectively.

## 5.0 TRAFFIC OPERATIONS ANALYSIS

---

Kimley-Horn's analysis of traffic operations in the site vicinity was conducted to determine potential capacity deficiencies in the 2022 and 2040 development horizons at the identified key intersections and access driveways. The acknowledged source for determining overall capacity is the current edition of the *Highway Capacity Manual (HCM)*<sup>2</sup>.

### 5.1 Analysis Methodology

Capacity analysis results are listed in terms of Level of Service (LOS). LOS is a qualitative term describing operating conditions a driver will experience while traveling on a particular street or highway during a specific time interval. It ranges from A (very little delay) to F (long delays and congestion). For intersections and roadways in this study area, standard traffic engineering practice identifies overall LOS D for signalized intersections and LOS E for movements and approaches of unsignalized intersections as the minimum threshold for acceptable operations.

**Table 2** shows the definition of level of service for signalized and unsignalized intersections.

**Table 2 – Level of Service Definitions**

Level of Service	Signalized Intersection Average Total Delay (sec/veh)	Unsignalized Intersection Average Total Delay (sec/veh)
A	≤ 10	≤ 10
B	> 10 and ≤ 20	> 10 and ≤ 15
C	> 20 and ≤ 35	> 15 and ≤ 25
D	> 35 and ≤ 55	> 25 and ≤ 35
E	> 55 and ≤ 80	> 35 and ≤ 50
F	> 80	> 50

Definitions provided from the Highway Capacity Manual, Sixth Edition, Transportation Research Board, 2016.

Study area intersections were analyzed based on average total delay analysis for signalized and unsignalized intersections. Under the unsignalized analysis, the level of service (LOS) for a two-way stop-controlled intersection is determined by the computed or measured control delay and is defined for each minor movement. Level of service for a two-way stop-controlled intersection is not defined for the intersection as a whole. Level of service for a signalized and four-way stop controlled intersection is defined for each approach and for the intersection.

---

<sup>2</sup> Transportation Research Board, *Highway Capacity Manual*, Sixth Edition, Washington DC, 2016.

## 5.2 Key Intersection Operational Analysis

Calculations for the level of service at the key intersections for the study area are provided in **Appendix D**. The existing year analysis is based on the lane geometry and intersection control shown in **Figure 3**. The signalized intersection analysis utilizes observed cycle lengths with existing phasing. Based on increased national attention given to allocating appropriate yellow and all-red clearance intervals to improve intersection safety, these have been calculated and are applied for the approaches to the signalized intersections. The increase in the yellow and all red time sacrifices intersection capacity for improved safety. Existing peak hour factors were used for the existing and 2022 conditions, and the recommended HCM urban area peak hour factor of 0.92 was used for the 2040 analysis. Synchro traffic analysis software was used to analyze the study area intersections and access drives for level of service. The Synchro Highway Capacity Manual (HCM) methodology reports were used to analyze intersection delay and level of service.

### 104<sup>th</sup> Avenue (SH-44) and Joliet Street

The existing intersection of 104<sup>th</sup> Avenue (SH-44) and Joliet Street is signalized with protected/permissive phasing on all the left turns. As such, this intersection is currently operating acceptably during morning and afternoon peak hours with LOS B. With the existing lane configuration and control, this intersection is anticipated to continue to operate acceptably with LOS B during the morning and afternoon peak hour with or without the addition of project traffic throughout the 2040 horizon. **Table 3** provides the results of the level of service at this intersection.

**Table 3 – 104<sup>th</sup> Avenue and Joliet Street LOS Results**

Scenario	AM Peak Hour		PM Peak Hour	
	Delay (sec)	LOS	Delay (sec)	LOS
2020 Existing	10.8	B	14.7	B
2022 Background	10.9	B	15.1	B
2022 Background Plus Project	11.2	B	16.1	B
2040 Background	11.1	B	17.4	B
2040 Background Plus Project	11.4	B	18.4	B

### 96<sup>th</sup> Avenue and Havana Street

The existing T-intersection of 96<sup>th</sup> Avenue and Havana Street is unsignalized with stop control on the southbound Havana Street approach. This intersection operates with an exclusive left turn lane and right turn lane on the southbound approach. With the existing lane configuration and control, as well as with the addition of project traffic, all movements at this intersection are expected to operate with acceptable level of service in the buildout year 2022 and the long term 2040 horizon. **Table 4** provides the results of the level of service at this intersection.

**Table 4 – 96<sup>th</sup> Avenue and Havana Street LOS Results**

Scenario	AM Peak Hour		PM Peak Hour	
	Delay (sec)	LOS	Delay (sec)	LOS
<b>2020 Existing</b> Eastbound Left Southbound Approach	8.0 10.4	A B	7.9 11.1	A B
<b>2022 Background</b> Eastbound Left Southbound Approach	8.1 10.5	A B	7.9 11.3	A B
<b>2022 Background Plus Project</b> Eastbound Left Southbound Approach	8.4 11.2	A B	8.0 12.3	A B
<b>2040 Background</b> Eastbound Left Southbound Approach	8.1 11.0	A B	8.0 11.9	A B
<b>2040 Background Plus Project</b> Eastbound Left Southbound Approach	8.4 11.6	A B	8.1 12.9	A B

### **96<sup>th</sup> Avenue and SH-2**

96<sup>th</sup> Avenue and SH-2 is a four-leg signalized intersection with an exclusive left turn lane, two through lanes, and an exclusive right turn lane on all four approaches. This intersection currently operates with LOS D during the morning peak hour and LOS C during the afternoon peak hour under the existing lane configuration and signal control. With or without the completion of the proposed development in 2022, the intersection is anticipated to operate acceptably with LOS D or better during both the morning and afternoon peak hours.

By 2040, the intersection of 96<sup>th</sup> Avenue and SH-2 may operate with long delays and unacceptable level of service if future traffic volume projections are realized. For this intersection to operate acceptably, an additional westbound left turn lane may need to be constructed for dual left turn lanes to operate with protected only phasing. The northbound right turn movement may need to operate with protected/overlap phasing. Likewise, a longer cycle length of 135 seconds (it operates with a 120-second cycle length today) would be beneficial during the morning peak hour. With the recommended improvements, this intersection is anticipated to operate at LOS D in the morning and afternoon peak hours with or without project traffic in 2040. **Table 5** provides the results of the level of service at this intersection.

**Table 5 – 96<sup>th</sup> Avenue and SH-2 LOS Results**

Scenario	AM Peak Hour		PM Peak Hour	
	Delay (sec)	LOS	Delay (sec)	LOS
<b>2020 Existing</b>	38.9	D	31.4	C
<b>2022 Background</b>	40.2	D	32.0	C
<b>2022 Background Plus Project</b>	41.0	D	32.5	C
<b>2040 Background #</b>	44.1	D	39.9	D
<b>2040 Background Plus Project #</b>	54.2	D	40.5	D

# = Dual Westbound Left Turns, Protected Westbound Left Turn, Protected/Overlap Northbound Right, 135 Second Cycle Length (AM Only)

With construction of the project, the City of Commerce City is requiring build out of the eastern half of Havana Street to the ultimate cross section along project frontage. Havana Street is classified as a major collector roadway; therefore, the widening is anticipated to consist of 12 additional feet with a 6-foot designated bicycle lane. To accommodate this roadway widening, an additional 13 feet of right-of-way will be dedicated along Havana Street.

#### **Havana Street Northern Right-In/Right-Out Access**

With development of the project, a northern right-in/right-out access is proposed to be located along Havana Street approximately 3,700 feet south of the 104<sup>th</sup> Avenue and Joliet Street intersection (measured center to center). It is recommended that the westbound approach of the access operate with stop control with the installation of an R1-1 "STOP" sign. To further identify the proposed access as a right-in/right-out driveway, it is recommended that a R3-5(R) Right Turn Only sign be installed underneath the stop sign. Also, a R3-2 No Left Turn sign should be installed on the southeast corner of the access intersection visible to southbound drivers along Havana Street. With completion of the proposed development, the westbound right turn exit at this access intersection are anticipated to operate acceptably during the peak hours for 2022 and 2040. **Table 6** provides the results of the level of service at this intersection.

**Table 6 –Havana Street Right-In/Right-Out Access LOS Results**

Scenario	AM Peak Hour		PM Peak Hour	
	Delay (sec)	LOS	Delay (sec)	LOS
<b>2022 Background Plus Project</b> Westbound Right Turn	8.7	A	8.8	A
<b>2040 Background Plus Project</b> Westbound Right Turn	8.7	A	8.9	A

### Havana Street Southern Full Access

A southern full movement access is proposed to be located along Havana Street approximately 4,100 feet south of the 104<sup>th</sup> Avenue and Joliet Street intersection (measured center to center). It is recommended that the westbound approach of the access operate with stop control with the installation of an R1-1 “STOP” sign. A southbound left turn lane and northbound right turn lane are anticipated at this intersection based on City standards and requirements. With completion of the proposed development, all movements at this intersection are anticipated to operate acceptably during the peak hours of 2022 and 2040. **Table 7** provides the results of the level of service at this intersection.

**Table 7 – Havana Street Southern Full Access LOS Results**

Scenario	AM Peak Hour		PM Peak Hour	
	Delay (sec)	LOS	Delay (sec)	LOS
<b>2022 Background Plus Project</b> Westbound Approach Southbound Left	9.7 7.6	A A	10.0 7.5	B A
<b>2040 Background Plus Project</b> Westbound Approach Southbound Left	9.8 7.6	A A	10.3 7.5	B A

### 5.3 CDOT Access Permit Analysis Need

The threshold for requiring an access permit along CDOT roadways occurs when project traffic is anticipated to increase the existing access traffic volumes by more than 20 percent. Both SH-2 and 104<sup>th</sup> Avenue (SH-44) exist as CDOT roadways within the project study area. Based on projections, the addition of 100<sup>th</sup> and Havana project traffic at the intersections of 96<sup>th</sup> Avenue/SH-2 and 104<sup>th</sup> Avenue (SH-44) and Joliet Street does not increase traffic volumes by more than 20 percent over existing; therefore, access permits are not anticipated to be required at these intersection locations.

## **5.4 Project Access Auxiliary Lane Analysis**

The City of Commerce City Engineering Construction Standards and Specifications were used to determine if turn lanes are warranted for access into the project accesses. The City of Commerce City classifies Havana Street as a major collector roadway.

According to section 3.04.1, a left turn lane with storage length plus taper length is required for all access on a Major Collector roadway, and a right turn lane with storage length plus taper is required for any access on a Major Collector roadway with a projected peak hour right ingress turning volume greater than 25 vehicles per hour (vph).

Based on the major collector roadway classification and 2022 traffic volume projections, turn lane requirements at the project intersections along Havana Street are as follows:

- A northbound right turn lane is not warranted for the Havana Street Northern Right-In/Right-Out Access based on projected 2022 background plus project traffic volumes being 20 northbound right turns during the peak hour and the threshold being 25 vph.
- A northbound right turn lane is warranted for the Havana Street Southern Full Movement Access based on projected 2022 background plus project traffic volumes being 50 northbound right turns during the peak hour and the threshold being 25 vph. It is recommended that this lane be constructed with a length of 90 feet plus a 175-foot taper.
- A southbound left turn lane is warranted for the Havana Street Full Movement Access based on Havana Street being a Major Collector roadway. It is recommended that the southbound left turn be 140 feet long (calculated as a 90-foot deceleration length plus 50-foot storage length) plus a 175-foot taper. Construction of this southbound left turn lane will require the through lanes along Havana Street to be transitioned around this left turn lane at a taper rate of approximately 20.5 to 1 (based on  $L = (W \cdot S^2)/60$ ). These through lane transitions will be planned and designed so that the bridge over the ditch to the north is not impacted.

## 5.5 Vehicle Queuing Analysis

Queuing analysis was conducted for the study area intersections per Commerce City standards and requirements. Results were obtained from the 95<sup>th</sup> percentile queue lengths obtained from the Synchro analysis. Queue analysis worksheets at the signalized intersections are provided in **Appendix E**. Queue length calculations for unsignalized intersections are provided within the level of service operational sheets provided in **Appendix D**. Results of the queuing analysis and recommendations at the study area intersections are provided in **Table 8**. Of note, any queue lengths calculated at less than one vehicle were rounded up to 25 feet to account for one vehicle of storage needed.

**Table 8 – Turn Lane Queuing Analysis Results**

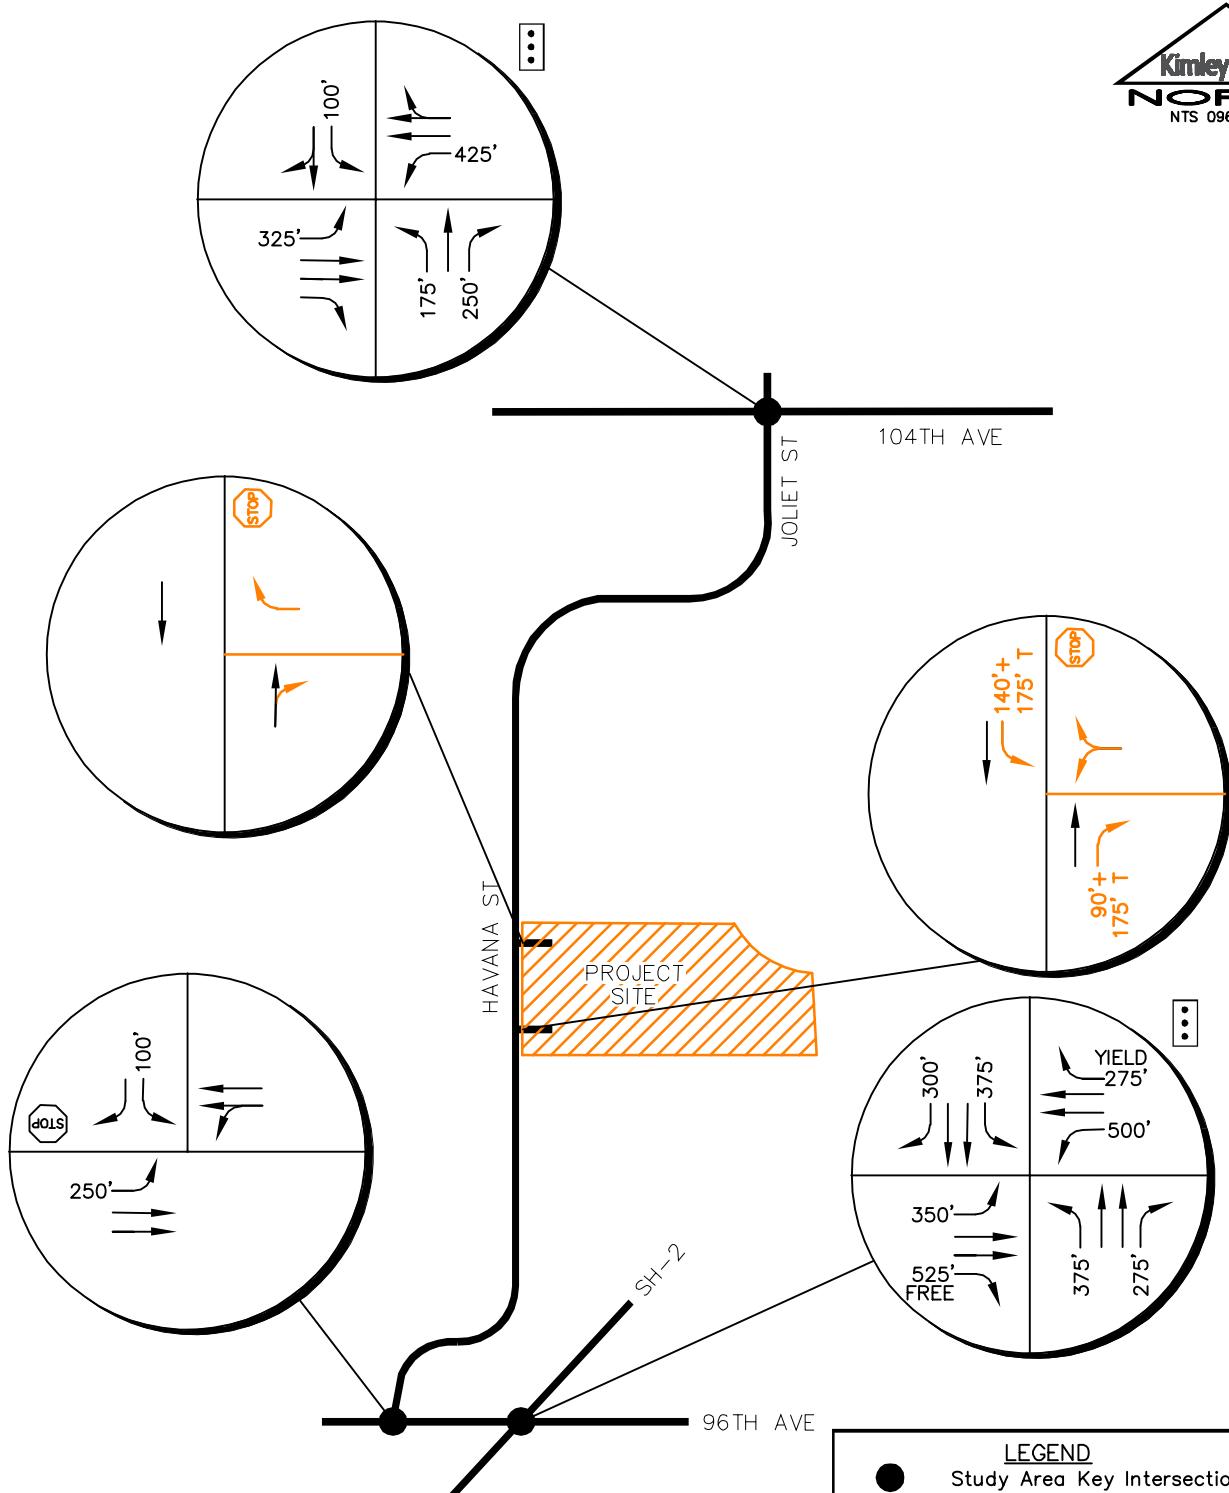

Intersection Turn Lane	Existing Turn Lane Length (feet)	2022 Calculated Queue (feet)	2022 Recommended Length (feet)	2040 Calculated Queue (feet)	2040 Recommended Length (feet)
<b>104<sup>th</sup> Avenue/Joliet Street</b>					
Eastbound Left	325'	25'	325'	29'	325'
Westbound Left	425'	40'	425'	66'	425'

Northbound Right	275'	138'	275'	280'	300'
Southbound Left	375'	55'	375'	122'	375'
Southbound Right	300'	25'	300'	25'	300'
<b>Havana Street RIRO Access</b>					
Westbound Approach	DNE	25'	C	25'	C
<b>Havana Street Full Access</b>					
Westbound Approach	DNE	25'	C	25'	C
Southbound Left	DNE	25'	140' (CCS)	25'	140' (CCS)
Northbound Right	DNE	25'	90' (CCS)	25'	90' (CCS)

DNE = Does Not Exist, C = Continuous Lane, CCS = City of Commerce City Engineering Construction Standards and Specifications

As shown in the table representing the queuing results, all anticipated queues are accommodated or managed within existing turn bay lengths with project traffic in the 2022 project build out year.

By 2040, the queue for the northbound right turn lane at the intersection of 96<sup>th</sup> Avenue and SH-2 may be longer than the available storage. Based on this, the existing 275-foot northbound right turn lane may need to be lengthened to 300 feet.

Based on the results of the traffic analysis, the key intersection recommended lanes and control are shown in **Figure 11** for the 2022 horizon and **Figure 12** for the 2040 horizon.

## **6.0 CONCLUSIONS AND RECOMMENDATIONS**

---

Based on the analysis presented in this report, Kimley-Horn believes the 100<sup>th</sup> and Havana project proposed on the east side of Havana Street between 102<sup>nd</sup> Avenue and Heinz Way will be successfully incorporated into the existing and future roadway network. The proposed project development resulted in the following recommendations and conclusions:

### **2022 Buildout Improvement Recommendations**

- The threshold for requiring access permits along CDOT roadways occurs when project traffic is anticipated to increase the existing access traffic volumes by more than 20 percent. Both SH-2 and 104<sup>th</sup> Avenue (SH-44) exist within the project study area and are CDOT roadways. Based on projections, the addition of 100<sup>th</sup> and Havana project traffic at the intersections of 96<sup>th</sup> Avenue/SH-2 and 104<sup>th</sup> Avenue (SH-44)/Joliet Street does not increase traffic volumes by more than 20 percent over existing; therefore, access permits are not anticipated to be required for these intersections.
- Direct access to the site is proposed to be one northern right-in/right-out access and one southern full movement access along Havana Street, approximately 3,700 feet and 4,100 feet (measured center to center) south of the 104<sup>th</sup> Avenue/Joliet Street intersection, respectively. It is recommended that the exiting access approaches at both accesses to Havana Street be stop controlled with the installation of R1-1 “STOP” signs. One vehicle of storage, 25 feet for passenger cars or 50 feet for trucks, of throat depth is recommended to be provided for the project accesses based on vehicle usage anticipated.
- To restrict the northern access to right turn movements only, it is recommended that a R3-5(R) Right Turn Only sign be installed underneath the STOP sign. Likewise, a R3-2 No Left Turn sign should be installed on the southeast corner of the access intersection visible to southbound drivers along Havana Street.
- Per City of Commerce City Standards, it is recommended that a 140-foot southbound left turn lane with a 175-foot taper be constructed at the southern full movement project access along Havana Street. Construction of this southbound left turn lane will require the through lanes along Havana Street to be transitioned around this left turn lane at a taper rate of

approximately 20.5 to 1 (based on  $L = (W^*S^2)/60$ ). These through lane transitions will be planned and designed so that the bridge over the ditch to the north is not impacted. Likewise, a northbound right turn lane of 90 feet with a 175-foot taper is warranted based on City standards for the southern access.

- With construction of the project, the City of Commerce City is requiring build out of the eastern half of Havana Street to the ultimate cross section along project frontage. Havana Street is classified as a Major Collector roadway; therefore, the widening is anticipated to consist of 12 additional feet with a 6-foot designated bicycle lane. To accommodate this roadway widening, an additional 13 feet of right-of-way will be dedicated along Havana Street.

#### **2040 Long-Term Improvement Recommendations**

- By 2040, the intersection of 96<sup>th</sup> Avenue and SH-2 may operate unacceptably during the morning peak hour with or without the addition of project traffic if future traffic volume projections are realized. In order for this intersection to operate acceptably at LOS D, an additional westbound left turn lane may need to be constructed for dual left turn lanes to operate with protected only phasing. Also, the northbound right turn lane may need to be extended from 275 feet to 300 feet and the northbound right turn movement may need to operate with protected overlap phasing. Of note, none of these improvements and movements are anticipated to include traffic from this project.

#### **General Improvements**

- All on-site improvements should be incorporated into the Civil Drawings and conform to standards of the City of Commerce City, The Colorado Department of Transportation (CDOT), and the Manual on Uniform Traffic Control Devices (MUTCD) – 2009 Edition.

## Trip Generation Worksheets

Project 100th and Havana  
Subject Trip Generation for Industrial Park  
Designed by TES Date April 13, 2020 Job No. 096441009  
Checked by \_\_\_\_\_ Date \_\_\_\_\_ Sheet No. \_\_\_\_\_ of \_\_\_\_\_

## TRIP GENERATION MANUAL TECHNIQUES

ITE Trip Generation Manual 10th Edition, Average Rate Equations

Land Use Code - Industrial Park (130)

Independant Variable - 1000 Square Feet Gross Floor Feet (X)

Gross Floor Area = 302,500

X = 302.5

T = Average Vehicle Trip Ends

### Peak Hour of Adjacent Street Traffic, One Hour Between 7 and 9 a.m. (100 Series Page 22)

T = 0.40 (X) T = 0.40 *	302.5	Directional Distribution: T = 121      Average Vehicle Trip Ends 98      entering      23      exiting	81% ent.    19% exit.
		98 + 23 = 121	

### Peak Hour of Adjacent Street Traffic, One Hour Between 4 and 6 p.m. (100 Series Page 23)

T = 0.40 (X) T = 0.40 *	302.5	Directional Distribution: T = 121      Average Vehicle Trip Ends 25      entering      96      exiting	21% ent.    79% exit.
		25 + 96 = 121	

### Weekday (100 Series Page 21)

T = 3.37 (X) T = 3.37 *	302.5	Directional Distribution: 50% entering, 50% exiting T = 1020      Average Vehicle Trip Ends 510      entering      510      exiting	
		510 + 510 = 1020

## Intersection Summary

Cycle Length: 70

Actuated Cycle Length: 70

Offset: 57 (81%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.50

Intersection Signal Delay: 8.0

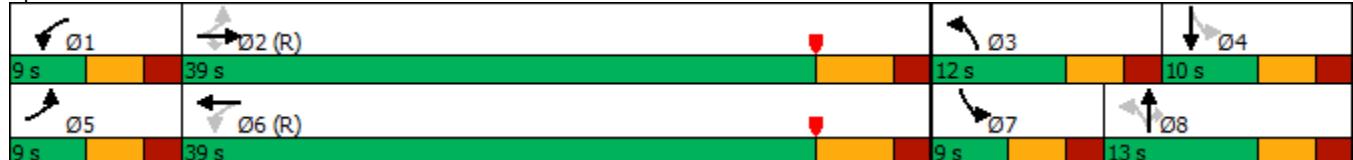

Intersection LOS: A

Intersection Capacity Utilization 59.7%

ICU Level of Service B

Analysis Period (min) 15

Splits and Phases: 1: Joliet Ave &amp; 104th Ave
