I. INTRODUCTION

A. Project Overview

Catellus Development Corporation is proposing to develop parcels P, Q, R, S, and T (a.k.a. Turnberry Filings 5 & 6) located in the Turnberry PUD in Commerce City, Colorado. The site is currently undeveloped and contains approximately 90.84 acres. The project site is bounded by SH 2 and a light industrial parcel currently within the jurisdictional limits of Adams County to the west, and undeveloped land to the north, east, and south. Upon build-out the development will contain 315 single-family detached homes. Figure 1 graphically illustrates the location of the project site and Figure 2 provides a conceptual site plan for the project.

The proposed Turnberry parcels P, Q, R, S, and T development will have direct access to the adjacent transportation system via the realignment of Revere St./Peoria St. through the development. The realigned Revere St./Peoria St. will intersect 104th Ave. to the north and 96th Ave. to the south in their existing locations. Figure 2 provides a graphical representation of the proposed access points for the development.

B. Purpose of Study

The purpose of this study is to evaluate the impact of the vehicular trips projected to be generated by the proposed Turnberry parcels P, Q, R, S, and T development on the study area intersections and roadway system. The study includes 2018 (existing), 2022 (year of anticipated build-out), and 2040 (long term) analysis horizons.

C. Study Area

The study area encompasses the existing roadway system in the vicinity of the project site. Specifically, the following existing intersections (with analysis node number indicated in parenthesis) were evaluated:

- SH 2/104th Ave. (1)
- 104th Ave./Revere St. (2)
- 104th Ave./Potomac St. (3)
- 96th Ave./Peoria St. (4)

Figure 1 graphically illustrates the location of the study area intersections.

II. EXISTING CONDITIONS

A. Existing Traffic Volumes

Existing (2018) peak hour intersection turning movement traffic volume counts were collected for this study at the following intersections in October, 2018:

- SH 2/104th Ave. (1)
- 104th Ave./Revere St. (2)
- 104th Ave./Potomac St. (3)
- 96th Ave./Peoria St. (4)

Existing (2018) 24-hour directional traffic volumes were collected for this study at the following locations in October 2018:

- SH 2 north of 104th Ave.
- 104th Ave. west of Revere St.
- Revere St. north of 104th Ave.
- Potomac St. north of 104th Ave.

A summary of the existing (2018) peak hour intersection turning movement traffic volume counts and 24-hour directional counts are graphically illustrated in Figure 3. Detailed traffic volume count data is provided in Appendix "A".

B. Existing Roadway System

The existing transportation network in the vicinity of the proposed development is graphically illustrated in Figure 1. The study area roadways include the following:

Study Area Roadways:

- **SH 2** – SH 2 is a 4-lane divided highway under the jurisdiction of the Colorado Department of Transportation (CDOT). It is classified as a Principal Arterial. The roadway section consists of two travel lanes in each direction with a painted center median and paved shoulder within the study area. There is a detached multi-use path along the east side of the roadway. The posted speed limit is 55 mph.
- **104th Ave.** – 104th Ave., east of SH 2, is 4-lane divided Principal Arterial under the jurisdiction of Commerce City. The roadway section consists of two travel lanes in each direction with a raised center median. There is curb and gutter and detached sidewalks on both sides of the roadway. The posted speed limit is 45 mph.
- **Revere St.** – Revere St., north of 104th Ave., is classified as a Minor/Residential Collector under the jurisdiction of Commerce City. The roadway section consists of two travel lanes in each direction with a raised center median between 104th Ave. and 104th Pl. North of 104th Pl. the roadway section narrows to one travel lane in each direction. There is curb and gutter and detached sidewalks on both sides of the roadway. The posted speed limit is 30 mph.
- **Peoria St.** - Peoria St., between 104th Ave. and 96th Ave., is currently a 2-lane gravel roadway with a posted speed limit of 40mph under the jurisdiction of the City of Commerce City. Based on the *City of Commerce City, C3 Vision, Transportation Plan*, dated July 2010, this segment of Peoria St. is planned to become a Multimodal Arterial Roadway. However, a Major Collector roadway section with a 120-foot right-of-way is being proposed through the Turnberry parcels P, Q, R, S, and T development. Per Commerce City Standard Detail 307-05 the typical section for a Major Collector roadway consists of 1-12-foot travel lane, a 6-foot bike lane, and curb and gutter in each direction with a 12-foot continuous two-way left turn lane in the center. Outside of the curb and gutter each side of the roadway has a 6-foot tree lawn and 5-foot sidewalk. The roadway will be posted for 30mph.
- **96th St.** – 96th St., north of SH 2, is classified as a Minor Arterial under the jurisdiction of Commerce City. Currently, the roadway section is paved and consists of one travel lane in each direction with no shoulders or sidewalks. The posted speed limit is 40mph.
- **Potomac St.** – Potomac St., between 104th Ave. and 96th Ave., is currently a 2-lane gravel roadway with a posted speed limit of 40mph under the jurisdiction of the City of Commerce City. Based on the *City of Commerce City, C3 Vision, Transportation Plan*,

dated July 2010, this segment of Peoria St. is planned to become a Multimodal Arterial roadway. North of 104th Ave. the roadway section has been constructed to the Multimodal Arterial section with a posted speed limit of 40mph.

Study Area Intersections:

- **SH 2/104th Ave.** – The SH 2/104th Ave. intersection is an actuated/coordinated signalized four-legged intersection with protected/permitted left turn phasing on all four approaches. The east leg of the intersection has dual left turn lanes with approximately a total of 750 feet of storage, two through lanes, and one channelized free right turn lane under yield control with approximately 300 feet of storage on the westbound approach and two eastbound departure lanes plus a northbound to eastbound right turn acceleration lane with approximately 800 feet. The west leg of the intersection has dual left turn lanes with approximately a total of 1050 feet of storage, two through lanes, and one channelized free right turn lane under yield control with approximately 880 feet of storage on the eastbound approach and two westbound departure lanes plus a southbound to westbound right turn acceleration lane with approximately 600 feet. The north leg of the intersection has one left turn lane with approximately 800 feet of storage, two through lanes, and one channelized free right turn lane with approximately 500 feet of storage on the southbound approach and two northbound departure lanes. The south leg of the intersection has one left turn lane with approximately 700 feet of storage, two through lanes, and one channelized free right turn lane with approximately 500 feet of storage on the northbound approach and two southbound departure lanes.
- **104th Ave./Revere St.** – At the time of the traffic counts (October 2018), the 104th Ave./Revere St. intersection was a full movement four-legged intersection with stop sign control on the northbound and southbound approaches. Since then it has become a signalized, actuated-coordinated four-legged intersection. The east leg of the intersection has one turn lane with approximately 375 feet of storage, two through lanes, and one channelized free right turn lane under yield control with approximately 300 feet of storage on the westbound approach and two eastbound departure lanes. The west leg of the intersection has dual left turn lanes with a total of approximately 625 feet of storage, two through lanes, and one channelized free right turn lane with approximately 260 feet of storage on the eastbound approach and two westbound departure lanes. The north leg of the intersection has one left turn lane with approximately 100 feet of storage, one through lane, and one right turn lane on the southbound approach and two northbound departure lanes. The south leg of the intersection has one left turn lane and one shared through/right turn lane on the northbound approach and one southbound departure lane.
- **104th Ave./Potomac St.** – The 104th Ave./Potomac St. intersection is an actuated/coordinated signalized four-legged intersection with protected left turn phasing on all four approaches. However, it is planned to implement protected/permitted left turn phasing on all four approaches in 2019. The east leg of the intersection has one left turn lane with approximately 450 feet of storage, one through lane, and one shared through/right turn lane on the westbound approach and two eastbound departure lanes. The west leg of the intersection has one left turn lane with approximately 575 feet of storage, one through lane, and one shared through/right turn lane on the eastbound approach and two westbound departure lanes. The north leg of the intersection has one left turn lane with approximately 225 feet of storage and one shared through/right turn lane on the southbound approach and one northbound departure lane. The south leg of the intersection has one left turn lane with approximately 100 feet of storage and one shared through/right turn lane on the northbound approach and one southbound departure lane.

- **96th Ave./Peoria St.** – The 96th Ave./Peoria St. intersection is a full movement four-legged intersection with stop sign control on the northbound and southbound approaches. The east leg of the intersection has one left turn lane with approximately 220 feet of storage and one shared through/right turn lane on the westbound approach and one eastbound departure lane. The west leg of the intersection has one left turn lane with approximately 150 feet of storage, one through lane and one right turn lane with approximately 250 feet of storage on the eastbound approach and one westbound departure lane. The north leg of the intersection has one shared left turn/through/right turn lane on the southbound approach and one northbound departure lane. The south leg of the intersection has one shared left turn/through/right turn lane on the northbound approach and one southbound departure lane.

III. BACKGROUND TRAFFIC

A. Background Traffic Volumes

Background traffic volume forecasts for the 2022 (build-out) and 2040 (long term) analysis horizons were developed for this study utilizing the following strategy:

- It is assumed that the Turnberry parcels P, Q, R, S, and T development will be built out by 2022 and contain 315 single-family detached homes.
- It is assumed that peak-hour distribution of background intersection approach traffic (left-turn, through, right-turn) at the study area intersections will remain constant through the 2040 (long term) analysis horizon.
- The traffic volume growth rates for the 2022 (build-out) and 2040 (long term) analysis horizons were computed as follows:
 - Utilizing the data contained in the DRCOG web site it was determined that the average annual traffic volume growth rate for SH 2 at the intersection of 104th Ave. is 3.52%. Therefore, an average annual traffic volume growth rate of 3.52% was selected to forecast the background traffic volumes for the 2022 and 2040 analysis horizons on the study area roadways and intersections. This equates to a 4-year (2018 to 2022) growth factor of 1.1484 and 22-year (2018 to 2040) growth factor of 2.141. These factors were applied to the 2018 (existing) traffic volumes to forecast the 2022 (build-out) and 2040 (long term) background traffic volumes for the study area roadways and intersections within the study area.
 - In order to forecast the 2022 (build-out) and 2040 (long term) background traffic volumes on Revere St. between 104th Ave. and 96th Ave. the following procedure was utilized:
 - 2022 (build-out) background traffic volume – It was assumed that there will be no additional development in place between 104th Ave. and 96th Ave. that would utilize Revere/Peoria realigned roadway through 2022. Therefore, the 2022 (build-out) traffic volume forecast for this segment of Revere/Peoria St. was forecast by applying the 4-year growth factor of 1.1484 to the 2018 (existing) traffic volumes.
 - 2040 (long term) background traffic volume – It was assumed that the undeveloped parcels of land to the north and south of the Turnberry parcels P, Q, R, S, and T development that would contribute traffic to the realigned Revere/Peoria St. would be developed by the 2040. It was also assumed that these undeveloped parcels would be developed with a similar land use (single-family detached housing with a gross density of 3.47 units/acre) as the Turnberry parcels P, Q, R, S, and T development. Therefore, site generated vehicle trips were projected, distributed and assigned to the realigned Revere/Peoria St.

based on this strategy to forecast the 2040 background traffic volumes. Figure 4 graphically illustrates the general locations of these undeveloped parcel areas assumed for these forecasts.

Figures 5 and 6 graphically illustrate the projected background traffic volumes for the 2022 (build-out) and 2040 (long term) analysis horizons, respectively.

B. Background Traffic Operational Analysis

In order to establish a base condition in which to evaluate the impact of the traffic generated by the proposed development on the study area intersections, peak hour capacity analyses were performed for the 2018 (existing), 2022 (build-out), 2040 (long term) analysis horizons background traffic conditions. These analyses utilized the methodologies contained in the *Highway Capacity Manual 6th Edition* (HCM) employing *Synchro 10* software and resulted in a qualitative measure of the operational characteristics of the intersection described by a letter designation ranging from "A" to "F" known as "Level of Service" (LOS). LOS "A" represents free-flow operating conditions, whereas LOS "F" represents excessive congestion and delay. Unsignalized intersection capacity analysis reports a LOS designation for each impeded intersection movement. Signalized intersection capacity analysis reports the overall LOS designation for the intersection as well as for each lane group and approach. LOS "D" is considered the minimum acceptable standard of operation.

The following study area intersections were analyzed:

- SH 2/104th Ave. (1)
- 104th Ave./Revere St. (2)
- 104th Ave./Potomac St. (3)
- 96th Ave./Peoria St. (4)

The results of these background traffic operational analyses are summarized graphically for the 2018 (existing), 2022 (build-out), and 2040 (long term) analysis horizons in Figures 7, 8 and 9, respectively. A summary of the results of the intersection capacity analyses is provided in Table 2 and detailed *Synchro 10* software intersection capacity analysis reports in Appendix "B".

IV. PROJECT DEVELOPMENT

A. Trip Generation

Project trip generation projections for the proposed Turnberry parcels P, Q, R, S, and T development were forecast utilizing the publication *Trip Generation, 10th Edition*, by the Institute of Transportation Engineers. Estimates of total daily traffic volume and AM and PM peak hour traffic volumes were calculated. Trip generation reductions due to transportation demand management, internal trips, or transit use were not considered.

For the purposes of this study, it is assumed that the subject parcel will be fully developed by 2022 containing 315 single-family detached homes. The proposed development is projected to generate 2,988 new daily vehicle trips of which 228 new trips are projected to be generated during the AM peak hour and 306 new trips are projected to be generated during the PM peak hour. Trip Generation projections are provided in Table 1.

TABLE 1
TRIP GENERATION

Land Use	Intensity	ITE Code	Daily (vpd)	Trip Generation			AM Peak Hour (vph)			PM Peak Hour (vph)		
				Total	In	Out	Total	In	Out	Total	In	Out
Single-Family Detached Housing	315 DU	210	2988	228	57	171	306	193	113			
Grand Total				2,988	228	57	171	306	193	113		

B. Trip Distribution

The distribution of the projected vehicle trips generated by the Turnberry parcels P, Q, R, S, and T development was established based on the current and projected future traffic patterns on the surrounding transportation system, efficiency of access to the principal transportation corridors serving the area, and the potential trip origins/destinations for the proposed land use for the subject property. Figure 10 graphically illustrates the project generated trip distribution patterns for the development.

C. Trip Assignment

The vehicular traffic volumes estimated to be generated by the proposed Turnberry parcels P, Q, R, S, and T development were assigned to the study area roadways and intersections utilizing the trip distribution analysis described above. Figure 11 graphically illustrates the site generated trip assignment for the Turnberry parcels P, Q, R, S, and T development.

V. TOTAL TRAFFIC

The total traffic forecasts for the 2022 (build-out), and 2040 (long term) analysis horizon scenarios were computed by combining the background traffic volumes for the respective scenario with the associated projected site generated traffic volumes. Figures 12 and 13 graphically illustrate the total traffic forecasts for the study area intersections for the 2022 (build-out) and 2040 (long term) analysis horizons, respectively.

VI. PROJECT ANALYSIS

A. Operational Analysis

In order to evaluate the traffic impacts of the proposed Turnberry parcels P, Q, R, S, and T development on the study area roadway system, peak hour intersection capacity analyses for total traffic conditions were performed for the 2022 (build-out) and 2040 (long term) analysis horizons at each of the study area intersections (with analysis node number indicated in parenthesis) listed below.

- SH 2/104th Ave. (1)
- 104th Ave./Revere St. (2)
- 104th Ave./Potomac St. (3)
- 96th Ave./Peoria St. (4)
- Peoria Pkwy./102nd Pl. (proposed) (5)
- Peoria Pkwy./Quentin St. (proposed) (6)

- Peoria Pkwy./101st Ave. (proposed) (7)

A narrative of the summary of the analyses and comparison to background traffic conditions for the 2018 (existing), 2022 (build-out), and 2040 (long term) analysis horizons is provided below. The results of the total traffic operational analysis are summarized graphically for the 2022 (build-out), and 2040 (long term) analysis horizons in Figures 14 and 15, respectively. A summary of the results of the intersection capacity analysis is provided in Table 2 and detailed *Synchro 10* software intersection capacity analysis reports are provided in Appendix “B”.

Study Area Intersections – Summary of Results:

- **SH 2/104th Ave. (1)** – The SH 2/104th Ave. intersection is not anticipated to undergo any significant geometric or operational modifications or improvements through the 2040 (long term) analysis horizon. Therefore, the analyses assumed that the intersection will remain under actuated/coordinated signalized control with protected/permitted left turn phasing on all four approaches and the laneage will remain the same. Based on these parameters and the existing and forecast traffic volumes, it is projected that all lane groups as well as the intersection, overall, will operate at acceptable levels of service (LOS “D” or better) through the 2022 (build-out) analysis horizon. Due to the forecast growth in the background traffic volume entering this intersection it is projected that the intersection, overall, as well as multiple lane groups will have unacceptable or failing levels of service (LOS “E” or worse) by the 2040 analysis horizon.
- **104th Ave./Revere St. (2)** – Under the existing (2018) operating conditions the analysis shows that the intersection, overall, is operating at acceptable levels of service. However, the northbound shared left turn/through/right turn movement during the PM peak hour and the southbound left turn and through movements during both the AM and PM peak hours experience failing levels of service. The operation of the northbound and southbound lane groups are projected to continue to deteriorate as traffic volumes grow. The intersection now exists (2020) as a four-legged signalized, actuated-coordinated intersection. It is assumed that by 2022, the 104th Ave./Revere St. intersection will have protected/permitted left turn phasing on all four approaches. The east leg of the intersection will have one left turn lane with a minimum of 375 feet of storage, two through lanes, and one free right turn lane with approximately 300 feet of storage under yield control on the westbound approach, and two eastbound departure lanes. The west leg of the intersection will have dual left turn lanes with a total of approximately 625 feet of storage, two through lanes, and one free right turn lane with approximately 260 feet of storage on the eastbound approach, and two westbound departure lanes. The north leg of the intersection will not have any modifications and has one left turn lane with approximately 100 feet of storage, one through lane, and one right turn lane on the southbound approach and, two northbound departure lanes. The south leg of the intersection will have one left turn lane with a minimum of 175 feet of storage and one shared through/right turn lane on the northbound approach, and two southbound departure lanes to accommodate the potential for future westbound to southbound dual left turn lanes. Based on these parameters and the forecast traffic volumes, it is projected that the intersection, overall, as well as all lane groups will operate at acceptable levels of service through the 2022 (build-out) analysis horizon. By the 2040 analysis horizon it is projected that the intersection, overall, as well as all lane groups will continue to operate at acceptable levels of service. However, during the PM peak hour the eastbound through, westbound left turn lane, and northbound shared through/right lane groups will deteriorate to unacceptable levels of service. Adding an additional eastbound through lane, westbound left turn lane, and north bound right turn lane would mitigate these poor levels of service. The additional westbound left turn lane could easily

- be implemented by restriping the approach. Adding an additional eastbound through lane and northbound right turn lane would require significant roadway widening.
- **104th Ave./Potomac St. (3)** – Under the existing (2018) operating conditions the analysis shows that intersection, overall, is operating at acceptable levels of service. However all four left turn lane groups are operating at failing levels of service with protected only left turn phasing. The City is planning to modify the left turn phasing on all four approaches to protected/permitted phasing in 2019 which will mitigate this problem. Based on this modification and the forecast traffic volumes, it is projected that the intersection, overall, as well as all lane groups will operate at acceptable levels of service through the 2022 (build-out) analysis horizon. By the 2040 analysis horizon it is projected that the intersection, overall, as well as the eastbound left turn and through/right turn lane, westbound through/right turn lane, and southbound left turn lane groups will deteriorate to unacceptable levels of service. This is primarily due to the high forecast east/west through traffic volumes on 104th Ave. Adding an additional eastbound through lane and westbound through lane would mitigate these poor levels of service.
 - **96th Ave./Peoria St. (4)** – The 96th Ave./Peoria St. intersection is not anticipated to undergo any significant geometric or operational modifications or improvements through the 2040 (long term) analysis horizon with the exception of paving the north leg of the intersection. Therefore, the analyses assumed that the intersection will remain under stop sign control on the northbound and southbound approaches and the laneage will remain the same. Based on these parameters and the existing and forecast traffic volumes, it is projected that the intersection, overall, as well as all impeded lane groups will operate at acceptable levels of service through the 2022 (build-out) analysis horizon total traffic conditions. It is projected that by the 2040 (long term) analysis horizon that the northbound and southbound lane groups will have failing levels of service and the intersection, overall, will deteriorate to failing levels of service with the addition of the development traffic. These poor levels of service are primarily due to the high forecast east/west through traffic volumes on 96th Ave.
 - **Peoria Pkwy./102nd Pl. (5)** – Concurrently, with the construction of the proposed Turnberry parcels P, Q, R, S, and T development the Peoria Pkwy./102nd Pl. intersection will be constructed as a full movement “T” intersection approximately 330 feet from the northern boundary of the site. The intersection will have stop sign control on the eastbound approach. The west leg of the intersection will have one shared left turn/right turn lane on the westbound approach and one eastbound departure lane. The north leg of the intersection will have one shared through/right turn lane on the southbound approach, and one northbound departure lane. The south leg of the intersection will have one left turn lane with a minimum of 50 feet of storage and one through lane on the northbound approach, and one southbound departure lane. Based on these parameters and the forecast traffic volumes, it is projected that all impeded lane groups, as well as the intersection overall, will operate at acceptable levels of service through the 2040 (long term) analysis horizon.
 - **Peoria Pkwy./Quentin St. (6)** – Concurrently, with the construction of the proposed Turnberry parcels P, Q, R, S, and T development the Peoria Pkwy./Quentin St. intersection will be constructed as a full movement four legged intersection approximately 500 feet south of the Peoria Pkwy./102nd Pl. intersection. The intersection will have stop sign control on the eastbound and westbound approaches. The east leg of the intersection will have one shared left turn/through/right turn lane on the westbound approach, and one eastbound departure lane. The west leg of the intersection will have one shared left turn/through/right turn lane on the eastbound approach, and one westbound departure lane. The north leg of the intersection will have one left turn lane

with a minimum of 50 feet of storage and one shared through/right turn lane on the southbound approach, and one northbound departure lane. The south leg of the intersection will have one left turn lane with a minimum of 50 feet of storage and one shared through/right turn lane on the northbound approach, and one southbound departure lane. Based on these parameters and the forecast traffic volumes, it is projected that all impeded lane groups, as well as the intersection overall, will operate at acceptable levels of service through the 2040 (long term) analysis horizon.

- **Peoria Pkwy./101st Ave. (7)** – Concurrently, with the construction of the proposed Turnberry parcels P, Q, R, S, and T development the Peoria Pkwy./101st Ave. intersection will be constructed as a full movement four legged intersection approximately 737 feet south of the Peoria Pkwy./Quentin St. intersection. The intersection will have stop sign control on the eastbound and westbound approaches. The east leg of the intersection will have one shared left turn/through/right turn lane on the westbound approach, and one eastbound departure lane. The west leg of the intersection will have one shared left turn/through/right turn lane on the eastbound approach, and one westbound departure lane. The north leg of the intersection will have one left turn lane with a minimum of 50 feet of storage and one shared through/right turn lane on the southbound approach, and one northbound departure lane. The south leg of the intersection will have one left turn lane with a minimum of 50 feet of storage and one shared through/right turn lane on the northbound approach, and one southbound departure lane. Based on these parameters and the forecast traffic volumes, it is projected that all impeded lane groups, as well as the intersection overall, will operate at acceptable levels of service through the 2040 (long term) analysis horizon.

B. Queuing Analysis

Queue lengths and associated storage requirements for auxiliary lanes (turn bays) at the study area intersections were calculated for the 2018 (existing), 2022 (build-out) background and total traffic, and 2040 (long term) background and total traffic scenarios utilizing the *Synchro 10 HCM 2010 95%tile reported queues*. The queue length calculations are based on a 25-foot vehicle length. Table 3 provides a summary of these analyses for each of the study area intersections.

A narrative of the summary of the queue length/storage requirement analysis and comparison to existing turn bay storage is provided below.

- **SH 2/104th Ave. (1)** – Based on the results of the queuing analysis it is projected that all of the existing turn bays serving the SH 2/104th Ave. intersection have sufficient capacity to serve the intersection through the 2022 (build-out) analysis horizon. By the 2040 (long term) analysis horizon it is projected that the westbound and northbound left turn

lane queues will exceed their respective turn lane capacities. The capacity of the westbound left turn lanes are restricted by the opposing eastbound left turn lane at Quari Ct. The northbound left turn lane could be expanded by restriping the painted median.

- **104th Ave./Revere St. (2)** – Based on the results of the queuing analysis it is projected that all of the intersection approach left turn and right turn lane storage capacities will have adequate capacity to serve the forecast traffic demand under traffic signal control through the 2040 analysis horizon, with the exception of the southbound left turn lane which will require at least 215 feet of storage by the 2040 analysis horizon.
- **104th Ave./Potomac St. (3)** – Based on the results of the queuing analysis it is projected that the existing eastbound, westbound, northbound, and southbound left turn lanes have adequate capacity in their current configurations to serve the intersection through the 2040 (long term) analysis horizon.
- **96th Ave./Peoria St. (4)** – Based on the results of the queuing analysis it is projected that the eastbound and westbound left turn lanes will have adequate capacity in their current configurations to serve the intersection through the 2040 analysis horizon.
- **Peoria Pkwy./102nd Pl. (5)** – Based on the results of the queuing analysis it is projected that the northbound left turn lane will require a minimum of 50 feet of storage.
- **Peoria Pkwy./Quentin St. (6)** – Based on the results of the queuing analysis it is projected that the northbound and southbound left turn lanes will require a minimum of 50 feet of storage.
- **Peoria Pkwy./101st Ave. (7)** – Based on the results of the queuing analysis it is projected that the northbound and southbound left turn lanes will require a minimum of 50 feet of storage.

C. Traffic Signal Warrant Analysis

The 104th Ave./Revere St. intersection was evaluated for meeting Traffic Signal Warrants based on the methodologies contained in the *Manual on Uniform Traffic Control Devices, 2009 Edition*. Traffic Signal Warrants 1 (Eight-Hour Vehicular Volume), 2 (Four-Hour Vehicular Volume) and 3 (Peak Hour) were evaluated for existing 2018 traffic conditions and projected 2022 (build-out) and 2040 (long term) analysis horizon background traffic conditions. The 2022 (build-out) and 2040 (long term) analysis horizon background traffic conditions were projected assuming the same hourly volume profile as the 2018 (existing) traffic volume profile. The results of this evaluation are summarized in Table 4, below.

The 96th Ave./Peoria St. intersection was evaluated for meeting Traffic Signal Warrants based on the methodologies contained in the *Manual on Uniform Traffic Control Devices, 2009 Edition*. Traffic Signal Warrant 3 (Peak Hour) was evaluated for existing 2018 traffic conditions and projected 2022 (build-out) and 2040 (long term) analysis horizon total traffic conditions. The results of this evaluation are summarized in Table 5, below. As shown in Table 5 a traffic signal is projected to be warranted based on Warrant 3 (Peak-Hour) by the 2022 (build-out) analysis horizon total traffic scenario. Traffic Signal Warrants 1 – (Eight-Hour) and 2 (Four-Hour) were not included in the analysis due to the lack of traffic volume on the northbound and southbound

approaches of the intersection. It is recommended that as development occurs in this area that this intersection be monitored for meeting additional traffic signal warrant criteria. Traffic Signal Warrant analysis worksheets are provided in Appendix "C".

2040 Total Traffic AM	YES

VII. CONCLUSION

Catellus Development Corporation is proposing to develop parcels P, Q, R, S, and T (a.k.a. Filings 5 & 6) located in the Turnberry PUD in Commerce City, Colorado. The site is currently undeveloped and contains approximately 90.84 acres. Upon build-out the development will contain 315 single-family detached homes. The proposed development will have direct access to the adjacent transportation system via the realignment of Revere St./Peoria St. (Peoria Pkwy.) through the development. The realigned Revere St./Peoria St. will intersect 104th Ave. to the north and 96th Ave. to the south in their existing locations. Upon build-out the proposed Turnberry parcels P, Q, R, S, and T development is projected to generate 2,988 new daily vehicle trips of which 228 new trips are projected to be generated during the AM peak hour and 306 new trips are projected to be generated during the PM peak hour.

Based on the analyses contained in this traffic study it is concluded that the proposed Turnberry parcels P, Q, R, S, and T development can be accommodated by the study area intersections and roadways through the 2040 (long term) analysis horizon with the modifications presented in Table 6, below.

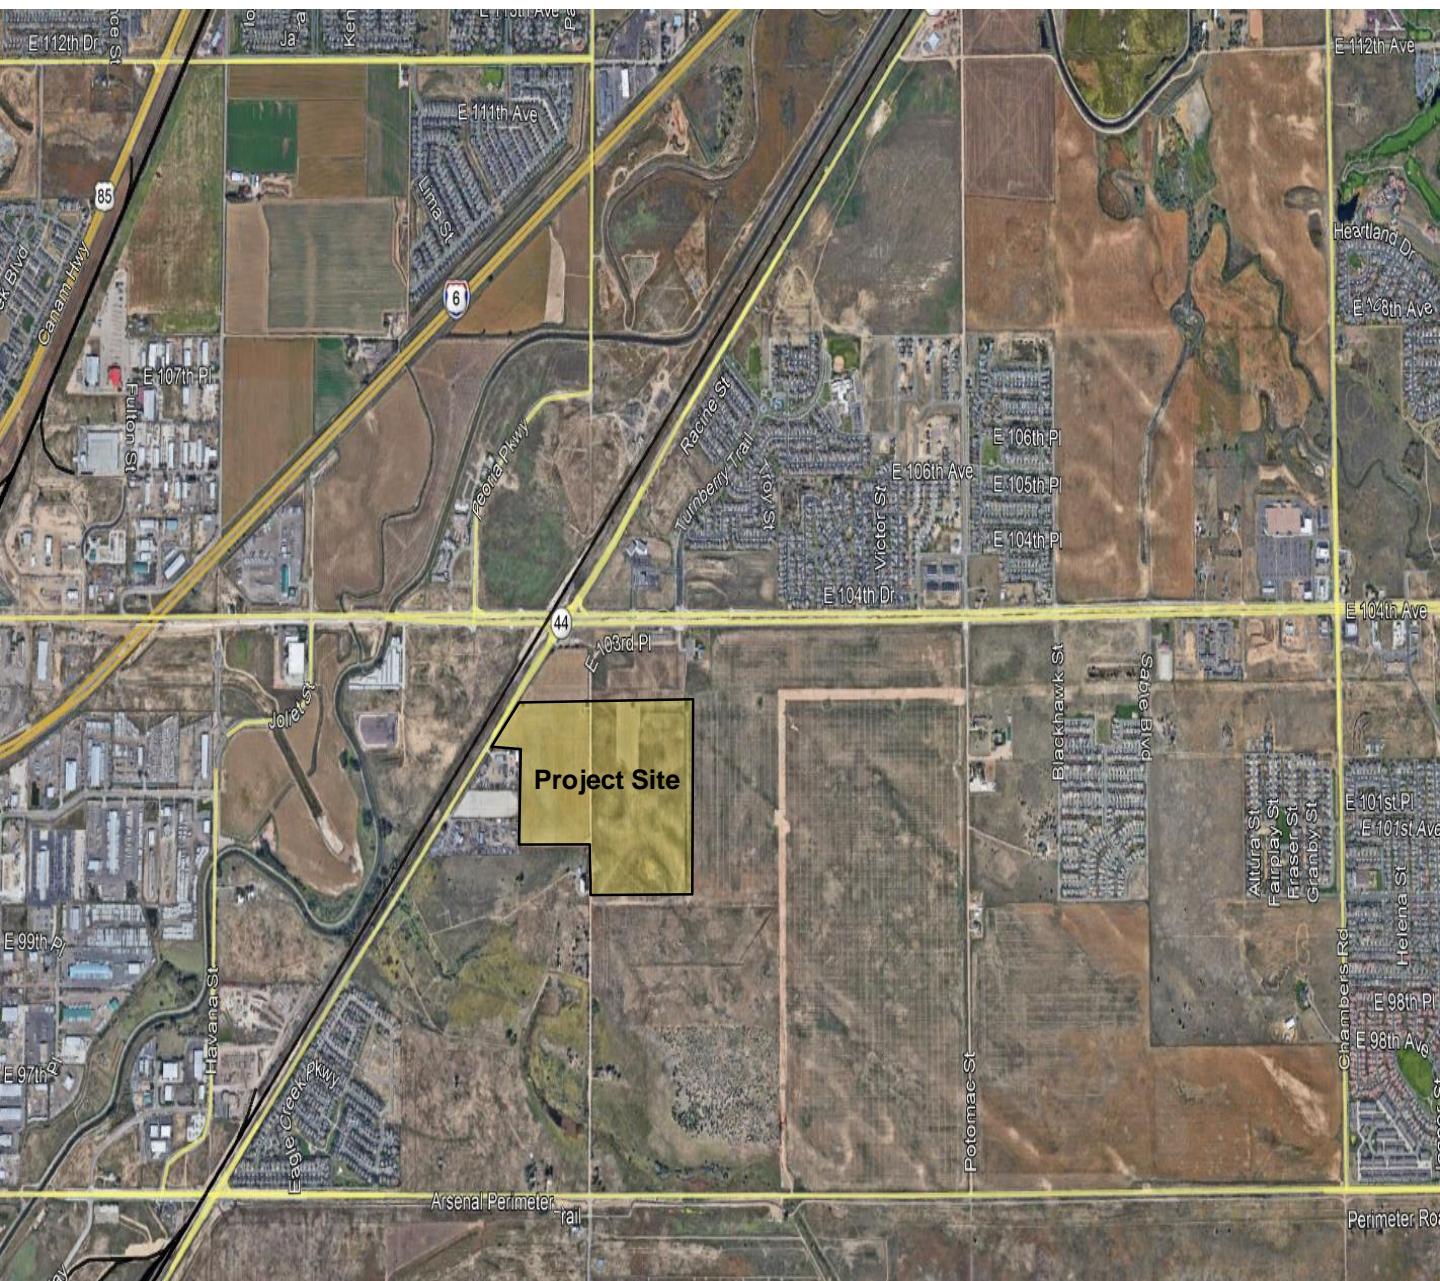

TABLE 6
SUMMARY OF RECOMMENDATIONS

Roadway	Recommendations	Responsible	Timing
Revere St./ Peoria St. (Peoria Pkwy.) (On-Site)	<p>It is recommended that the realignment of Revere/Peoria St. through the proposed Turnberry parcels P, Q, R, S, and T development be constructed as a Major Collector roadway per Commerce City Standard Detail 307-05. The roadway section shall consist of a 120-foot right-of-way containing a 1-12-foot travel lane, a 6-foot bike lane, and curb and gutter in each direction with a 12-foot continuous two-way left turn lane in the center. Outside of the curb and gutter each side of the roadway shall have a 6-foot tree lawn and 5-foot sidewalk. The roadway shall have a posted speed limit of 30mph.</p>	Developer	Concurrently with Project
Revere St./ Peoria St. (Off-Site)	<p>It is anticipated that the realignment of Revere/Peoria St. between 104th Ave. and 96th Ave., excluding the Turnberry parcels P, Q, R, S, and T development site, will be constructed as a Major Collector per Commerce City Standard Detail 307-05.</p>	TBD	TBD
Intersection	Recommendations	Responsible	Timing
SH 2/104 th Ave. (1)	No geometric or operational modifications are recommended at this intersection as a result of the development of the proposed Turnberry parcels P, Q, R, S, and T project.	N/A	N/A
104 th Ave./ Revere St. (2)	<p>As development occurs south of 104th Ave. the intersection should be modified to have actuated/coordinated traffic signal control with protected/permitted left turn phasing on all four approaches. The east leg of the intersection will have one left turn lane with a minimum of 375 feet of storage, two through lanes, and one free right turn lane with approximately 300 feet of storage under yield control on the westbound approach, and two eastbound departure lanes. The west leg of the intersection will have dual left turn lanes with a minimum total of 625 feet of storage, two through lanes, and one free right turn lane with a minimum of 260 feet of storage on the eastbound approach, and two westbound departure lanes. The north leg of the intersection will not require any modifications and has one left turn lane with approximately 100 feet of storage, one through lane, and one right turn lane on the southbound approach and, two northbound departure lanes. The south leg of the intersection will have one left turn lane with a minimum of 175 feet of storage and one shared through/right turn lane on the northbound approach, and two southbound departure lanes to accommodate the potential for future westbound to southbound dual left turn lanes.</p>	TBD	TBD
104 th Ave./ Potomac St. (3)	<p>No geometric or operational modifications are recommended at this intersection as a result of the development of the proposed Turnberry parcels P, Q, R, S, and T project.</p> <p>The City is planning to modify the left turn phasing on all four approaches to protected/permitted phasing in 2019 to improve overall traffic operations.</p>	N/A City	N/A City

TABLE 6 (CONTINUED)
SUMMARY OF RECOMMENDATIONS

Intersection	Recommendations	Responsible	Timing
96 th Ave./ Peoria St. (4)	No geometric or operational modifications are recommended at this intersection as a result of the development of the proposed Turnberry parcels P, Q, R, S, and T project.	N/A	N/A
Peoria Pkwy. /102 nd Pl. (5)	The intersection shall be constructed as a full movement "T" intersection approximately 330 feet from the northern boundary of the site. The intersection will have stop sign control on the eastbound approach. The west leg of the intersection will have one shared left turn/right turn lane on the westbound approach and one eastbound departure lane. The north leg of the intersection will have one shared through/right turn lane on the southbound approach, and one northbound departure lane. The south leg of the intersection will have one left turn lane with a minimum of 50 feet of storage and one through lane on the northbound approach, and one southbound departure lane.	Developer	Concurrently with Project
Peoria Pkwy./ Quentin St. (6)	The intersection shall be constructed as a full movement four-legged intersection approximately 500 feet south of the Peoria Pkwy./102 nd Pl. intersection. The intersection will have stop sign control on the eastbound and westbound approaches. The east leg of the intersection will have one shared left turn/through/right turn lane on the westbound approach, and one eastbound departure lane. The west leg of the intersection will have one shared left turn/through/right turn lane on the eastbound approach, and one westbound departure lane. The north leg of the intersection will have one left turn lane with a minimum of 50 feet of storage and one shared through/right turn lane on the southbound approach, and one northbound departure lane. The south leg of the intersection will have one left turn lane with a minimum of 50 feet of storage and one shared through/right turn lane on the northbound approach, and one southbound departure lane.	Developer	Concurrently with Project
Peoria Pkwy. /102 nd Pl. (5)	The intersection shall be constructed as a full movement four-legged intersection approximately 737 feet south of the Peoria Pkwy./Quentin St. intersection. The intersection will have stop sign control on the eastbound and westbound approaches. The east leg of the intersection will have one shared left turn/through/right turn lane on the westbound approach, and one eastbound departure lane. The west leg of the intersection will have one shared left turn/through/right turn lane on the eastbound approach, and one westbound departure lane. The north leg of the intersection will have one left turn lane with a minimum of 50 feet of storage and one shared through/right turn lane on the southbound approach, and one northbound departure lane. The south leg of the intersection will have one left turn lane with a minimum of 50 feet of storage and one shared through/right turn lane on the northbound approach, and one southbound departure lane. 2018 Existing Traffic Signal Warrant Summary Worksheet

70%

The Worksheet(s) attached are provided as an attachment to the Engineering Investigation Study for:

Intersection: E 104th Ave and Revere St

County: Adams County

City: Commerce City

Major Street: E 104th Ave

Critical Approach Speed: 45 mph

Lanes: 2 or more lanes

Minor Street: Revere St

Critical Approach Speed: 30 mph

Lanes: 2 or more lanes

% Right Turns Included

From North (SB) 0%

From East (WB) 0%

From South (NB) 0%

From West (EB) 0%

In built-up area of isolated community of < 10,000 population? No

Total number of approaches at intersection? 4 or more

If it is a "T" intersection, inflate minor threshold to 150%? No

Manually set volume level? No

Analysis based on EXISTING volume data.
